

The code of the package **nicematrix**^{*}

F. Pantigny
fpantigny@wanadoo.fr

February 19, 2024

Abstract

This document is the documented code of the LaTeX package **nicematrix**. It is *not* its user's guide. The guide of utilisation is the document **nicematrix.pdf** (with a French traduction: **nicematrix-french.pdf**).

By default, the package **nicematrix** doesn't patch any existing code.

However, when the option **renew-dots** is used, the commands **\cdots**, **\ldots**, **\dots**, **\vdots**, **\ddots** and **\iddots** are redefined in the environments provided by **nicematrix**. In the same way, if the option **renew-matrix** is used, the environment **\matrix** of **amsmath** is redefined.

On the other hand, the environment **\array** is never redefined.

Of course, the package **nicematrix** uses the features of the package **array**. It tries to be independent of its implementation. Unfortunately, it was not possible to be strictly independent. For example, the package **nicematrix** relies upon the fact that the package **\array** uses **\ialign** to begin the **\halign**.

1 Declaration of the package and packages loaded

The prefix **nicematrix** has been registered for this package.

See: [<http://mirrors.ctan.org/macros/latex/contrib/l3kernel/l3prefixes.pdf>](http://mirrors.ctan.org/macros/latex/contrib/l3kernel/l3prefixes.pdf)

First, we load **pgfcore** and the module **shapes**. We do so because it's not possible to use **\usepgfmodule** in **\ExplSyntaxOn**.

```
1 \RequirePackage{pgfcore}
2 \usepgfmodule{shapes}
```

We give the traditional declaration of a package written with the L3 programming layer.

```
3 \RequirePackage{l3keys2e}
4 \ProvidesExplPackage
5   {nicematrix}
6   {\myfiledate}
7   {\myfileversion}
8   {Enhanced arrays with the help of PGF/TikZ}
```

The command for the treatment of the options of **\usepackage** is at the end of this package for technical reasons.

We load some packages.

```
9 \RequirePackage { array }
10 \RequirePackage { amsmath }
```

^{*}This document corresponds to the version 6.27a of **nicematrix**, at the date of 2024/02/19.

```

11 \cs_new_protected:Npn \@@_error:n { \msg_error:nn { nicematrix } }
12 \cs_new_protected:Npn \@@_warning:n { \msg_warning:nn { nicematrix } }
13 \cs_new_protected:Npn \@@_error:nn { \msg_error:nnn { nicematrix } }
14 \cs_generate_variant:Nn \@@_error:nn { n e }
15 \cs_new_protected:Npn \@@_error:nnn { \msg_error:nnnn { nicematrix } }
16 \cs_new_protected:Npn \@@_fatal:n { \msg_fatal:nn { nicematrix } }
17 \cs_new_protected:Npn \@@_fatal:nn { \msg_fatal:nnn { nicematrix } }
18 \cs_new_protected:Npn \@@_msg_new:nn { \msg_new:nnn { nicematrix } }

```

With Overleaf, by default, a document is compiled in non-stop mode. When there is an error, there is no way to the user to use the key H in order to have more information. That's why we decide to put that piece of information (for the messages with such information) in the main part of the message when the key `messages-for-Overleaf` is used (at load-time).

```

19 \cs_new_protected:Npn \@@_msg_new:nnn #1 #2 #3
20 {
21     \bool_if:NTF \g_@@_messages_for_Overleaf_bool
22         { \msg_new:nnn { nicematrix } { #1 } { #2 \\ #3 } }
23         { \msg_new:nnnn { nicematrix } { #1 } { #2 } { #3 } }
24 }

```

We also create a command which will generate usually an error but only a warning on Overleaf. The argument is given by currying.

```

25 \cs_new_protected:Npn \@@_error_or_warning:n
26     { \bool_if:NTF \g_@@_messages_for_Overleaf_bool \@@_warning:n \@@_error:n }

```

We try to detect whether the compilation is done on Overleaf. We use `\c_sys_jobname_str` because, with Overleaf, the value of `\c_sys_jobname_str` is always “output”.

```

27 \bool_new:N \g_@@_messages_for_Overleaf_bool
28 \bool_gset:Nn \g_@@_messages_for_Overleaf_bool
29 {
30     \str_if_eq_p:on \c_sys_jobname_str { _region_ } % for Emacs
31     || \str_if_eq_p:on \c_sys_jobname_str { output } % for Overleaf
32 }

33 \cs_new_protected:Npn \@@_msg_redirect_name:nn
34     { \msg_redirect_name:nnn { nicematrix } }
35 \cs_new_protected:Npn \@@_gredirect_none:n #1
36 {
37     \group_begin:
38     \globaldefs = 1
39     \@@_msg_redirect_name:nn { #1 } { none }
40     \group_end:
41 }
42 \cs_new_protected:Npn \@@_err_gredirect_none:n #1
43 {
44     \@@_error:n { #1 }
45     \@@_gredirect_none:n { #1 }
46 }
47 \cs_new_protected:Npn \@@_warning_gredirect_none:n #1
48 {
49     \@@_warning:n { #1 }
50     \@@_gredirect_none:n { #1 }
51 }

```

2 Security test

Within the package `nicematrix`, we will have to test whether a cell of a `{NiceTabular}` is empty. For the cells of the columns of type p, b, m, X and V, we will test whether the cell is syntactically empty

(that is to say that there is only spaces between the ampersands &). That test will be done with the command `\@@_test_if_empty`: by testing if the two first tokens in the cells are (during the TeX process) are `\ignorespaces` and `\unskip`.

However, if, one day, there is a changement in the implementation of `array`, maybe that this test will be broken (and `nicematrix` also).

That's why, by security, we will take a test in a small `{tabular}` composed in the box `\l_tmpa_box` used as sandbox.

```

52 \@@_msg_new:nn { Internal-error }
53 {
54   Potential~problem~when~using~nicematrix.\\
55   The~package~nicematrix~have~detected~a~modification~of~the~
56   standard~environment~{array}~(of~the~package~array).~Maybe~you~will~encounter~
57   some~slight~problems~when~using~nicematrix.~If~you~don't~want~to~see~
58   this~message~again,~load~nicematrix~with:~\token_to_str:N
59   \usepackage[no-test-for-array]{nicematrix}.
60 }

61 \@@_msg_new:nn { mdwtab-loaded }
62 {
63   The~packages~'mdwtab'~and~'nicematrix'~are~incompatible.~
64   This~error~is~fatal.
65 }

66 \cs_new_protected:Npn \@@_security_test:n #1
67 {
68   \peek_meaning:NTF \ignorespaces
69   {
70     \@@_security_test_i:w
71     \@@_error:n { Internal-error } }
72 }

73 \cs_new_protected:Npn \@@_security_test_i:w \ignorespaces #1
74 {
75   \peek_meaning:NF \unskip { \@@_error:n { Internal-error } }
76   #1
77 }
```

Here, the box `\l_tmpa_box` will be used as sandbox to take our security test. This code has been modified in version 6.18 (see question 682891 on TeX StackExchange).

```

78 \hook_gput_code:nnn { begindocument / after } { . }
79 {
80   \IfPackageLoadedTF { mdwtab }
81   {
82     \@@_fatal:n { mdwtab-loaded } }
83   {
84     \bool_if:NF \g_@@_no_test_for_array_bool
85     {
86       \group_begin:
87         \hbox_set:Nn \l_tmpa_box
88         {
89           \begin { tabular } { c > { \@@_security_test:n } c c }
90           text & & text
91           \end { tabular }
92         }
93       \group_end:
94     }
95 }
```

3 Collecting options

The following technic allows to create user commands with the ability to put an arbitrary number of [list of (key=val)] after the name of the command.

Exemple :

```
\@@_collect_options:n { \F } [x=a,y=b] [z=c,t=d] { arg }
```

will be transformed in : \F{x=a,y=b,z=c,t=d}{arg}

Therefore, by writing : \def\G{\@@_collect_options:n{\F}},
the command \G takes in an arbitrary number of optional arguments between square brackets.
Be careful: that command is *not* “fully expandable” (because of \peek_meaning:NTF).

```
96 \cs_new_protected:Npn \@@_collect_options:n #1
97 {
98   \peek_meaning:NTF [
99     { \@@_collect_options:nw { #1 } }
100    { #1 { } }
101 }
```

We use \NewDocumentCommand in order to be able to allow nested brackets within the argument between [and].

```
102 \NewDocumentCommand \@@_collect_options:nw { m r[] }
103   { \@@_collect_options:nn { #1 } { #2 } }

104
105 \cs_new_protected:Npn \@@_collect_options:nn #1 #2
106 {
107   \peek_meaning:NTF [
108     { \@@_collect_options:nnw { #1 } { #2 } }
109     { #1 { #2 } }
110 }
111
112 \cs_new_protected:Npn \@@_collect_options:nnw #1#2[#3]
113   { \@@_collect_options:nn { #1 } { #2 , #3 } }
```

4 Technical definitions

The following constants are defined only for efficiency in the tests.

```
114 \tl_const:Nn \c_@@_b_tl { b }
115 \tl_const:Nn \c_@@_c_tl { c }
116 \tl_const:Nn \c_@@_l_tl { l }
117 \tl_const:Nn \c_@@_r_tl { r }
118 \tl_const:Nn \c_@@_all_tl { all }
119 \tl_const:Nn \c_@@_dot_tl { . }
120 \tl_const:Nn \c_@@_default_tl { default }
121 \tl_const:Nn \c_@@_star_tl { * }
122 \str_const:Nn \c_@@_r_str { r }
123 \str_const:Nn \c_@@_c_str { c }
124 \str_const:Nn \c_@@_l_str { l }
125 \str_const:Nn \c_@@_R_str { R }
126 \str_const:Nn \c_@@_C_str { C }
127 \str_const:Nn \c_@@_L_str { L }
128 \str_const:Nn \c_@@_j_str { j }
129 \str_const:Nn \c_@@_si_str { si }
```

The following token list will be used for definitions of user commands (with `\NewDocumentCommand`) with an embellishment using an *underscore* (there may be problems because of the catcode of the underscore).

```

130 \tl_new:N \l_@_argspec_tl
131 \cs_generate_variant:Nn \seq_set_split:Nnn { N V n }
132 \cs_generate_variant:Nn \str_lowercase:n { V }

133 \hook_gput_code:nnn { begindocument } { . }
134 {
135   \IfPackageLoadedTF { tikz }
136   {

```

In some constructions, we will have to use a `{pgfpicture}` which *must* be replaced by a `{tikzpicture}` if Tikz is loaded. However, this switch between `{pgfpicture}` and `{tikzpicture}` can't be done dynamically with a conditional because, when the Tikz library `external` is loaded by the user, the pair `\tikzpicture-\endtikzpicture` (or `\begin{tikzpicture}-\end{tikzpicture}`) must be statically “visible” (even when externalization is not activated).

That's why we create `\c_@@_pgfortikzpicture_tl` and `\c_@@_endpgfortikzpicture_tl` which will be used to construct in a `\AtBeginDocument` the correct version of some commands. The tokens `\exp_not:N` are mandatory.

```

137   \tl_const:Nn \c_@@_pgfortikzpicture_tl { \exp_not:N \tikzpicture }
138   \tl_const:Nn \c_@@_endpgfortikzpicture_tl { \exp_not:N \endtikzpicture }
139   }
140   {
141     \tl_const:Nn \c_@@_pgfortikzpicture_tl { \exp_not:N \pgfpicture }
142     \tl_const:Nn \c_@@_endpgfortikzpicture_tl { \exp_not:N \endpgfpicture }
143   }
144 }
```

We test whether the current class is `revtex4-1` (deprecated) or `revtex4-2` because these classes redefines `\array` (of `array`) in a way incompatible with our programmation. At the date May 2023, the current version `revtex4-2` is 4.2f (compatible with `booktabs`).

```

145 \IfClassLoadedTF { revtex4-1 }
146   { \bool_const:Nn \c_@@_revtex_bool \c_true_bool }
147   {
148     \IfClassLoadedTF { revtex4-2 }
149       { \bool_const:Nn \c_@@_revtex_bool \c_true_bool }
150     }
```

Maybe one of the previous classes will be loaded inside another class... We try to detect that situation.

```

151 \cs_if_exist:NT \rvtx@ifformat@geq
152   { \bool_const:Nn \c_@@_revtex_bool \c_true_bool }
153   { \bool_const:Nn \c_@@_revtex_bool \c_false_bool }
154 }
155 }

156 \cs_generate_variant:Nn \tl_if_single_token_p:n { V }
```

If the final user uses `nicematrix`, PGF/Tikz will write instruction `\pgfsyspdfmark` in the `aux` file. If he changes its mind and no longer loads `nicematrix`, an error may occur at the next compilation because of remanent instructions `\pgfsyspdfmark` in the `aux` file. With the following code, we try to avoid that situation.

```

157 \cs_new_protected:Npn \@@_provide_pgfsyspdfmark:
158   {
159     \iow_now:Nn \mainaux
160     {
161       \ExplSyntaxOn
162       \cs_if_free:NT \pgfsyspdfmark
163         { \cs_set_eq:NN \pgfsyspdfmark \gobblethree }
164       \ExplSyntaxOff
```

```

165     }
166     \cs_gset_eq:NN \@@_provide_pgfsyspdfmark: \prg_do_nothing:
167 }

```

We define a command `\iddots` similar to `\ddots` but with dots going forward ($\cdot\cdot$). We use `\ProvideDocumentCommand` and so, if the command `\iddots` has already been defined (for example by the package `mathdots`), we don't define it again.

```

168 \ProvideDocumentCommand \iddots { }
169 {
170   \mathinner
171   {
172     \tex_mkern:D 1 mu
173     \box_move_up:nn { 1 pt } { \hbox { . } }
174     \tex_mkern:D 2 mu
175     \box_move_up:nn { 4 pt } { \hbox { . } }
176     \tex_mkern:D 2 mu
177     \box_move_up:nn { 7 pt }
178     { \vbox:n { \kern 7 pt \hbox { . } } }
179     \tex_mkern:D 1 mu
180   }
181 }

```

This definition is a variant of the standard definition of `\ddots`.

In the `aux` file, we will have the references of the PGF/Tikz nodes created by `nicematrix`. However, when `booktabs` is used, some nodes (more precisely, some `row` nodes) will be defined twice because their position will be modified. In order to avoid an error message in this case, we will redefine `\pgfutil@check@rerun` in the `aux` file.

```

182 \hook_gput_code:nnn { begindocument } { . }
183 {
184   \IfPackageLoadedTF { booktabs }
185   { \iow_now:Nn \mainaux \nicematrix@redefine@check@rerun }
186   { }
187 }
188 \cs_set_protected:Npn \nicematrix@redefine@check@rerun
189 {
190   \cs_set_eq:NN \@@_old_pgfutil@check@rerun \pgfutil@check@rerun

```

The new version of `\pgfutil@check@rerun` will not check the PGF nodes whose names start with `nm-` (which is the prefix for the nodes created by `nicematrix`).

```

191   \cs_set_protected:Npn \pgfutil@check@rerun ##1 ##2
192   {
193     \str_if_eq:eeF { nm- } { \tl_range:nnn { ##1 } 1 3 }
194     { \@@_old_pgfutil@check@rerun { ##1 } { ##2 } }
195   }
196 }

```

We have to know whether `colortbl` is loaded in particular for the redefinition of `\everycr`.

```

197 \hook_gput_code:nnn { begindocument } { . }
198 {
199   \IfPackageLoadedTF { colortbl }
200   { }
201   {

```

The command `\CT@arc@` is a command of `colortbl` which sets the color of the rules in the array. We will use it to store the instruction of color for the rules even if `colortbl` is not loaded.

```

202   \cs_set_protected:Npn \CT@arc@ { }
203   \cs_set:Npn \arrayrulecolor #1 # { \CT@arc { #1 } }
204   \cs_set:Npn \CT@arc #1 #
205   {
206     \dim_compare:nNnT \baselineskip = \c_zero_dim \noalign
207       { \cs_gset_nopar:Npn \CT@arc@ { \color {#1} { #2 } } }
208   }

```

Idem for `\CT@drs@`.

```

209   \cs_set:Npn \doublerulesepcolor #1 # { \CT@drs { #1 } }
210   \cs_set:Npn \CT@drs #1 #
211   {
212     \dim_compare:nNnT \baselineskip = \c_zero_dim \noalign
213     { \cs_gset:Npn \CT@drsc@ { \color #1 { #2 } } }
214   }
215   \cs_set:Npn \hline
216   {
217     \noalign { \ifnum 0 = ' } \fi
218     \cs_set_eq:NN \hskip \vskip
219     \cs_set_eq:NN \vrule \hrule
220     \cs_set_eq:NN \owidth \oheight
221     { \CT@arc@ \vline }
222     \futurelet \reserved@a
223     \oheight
224   }
225 }
226 }
```

We have to redefine `\cline` for several reasons. The command `\@@_cline` will be linked to `\cline` in the beginning of `{NiceArrayWithDelims}`. The following commands must *not* be protected.

```

227 \cs_set:Npn \@@_standard_cline #1 { \@@_standard_cline:w #1 \q_stop }
228 \cs_set:Npn \@@_standard_cline:w #1-#2 \q_stop
229 {
230   \int_if_zero:nT \l_@@_first_col_int { \omit & }
231   \int_compare:nNnT { #1 } > \c_one_int
232   { \multispan { \int_eval:n { #1 - 1 } } & }
233   \multispan { \int_eval:n { #2 - #1 + 1 } }
234   {
235     \CT@arc@
236     \leaders \hrule \oheight \arrayrulewidth \hfill
237   }
238 }
```

The following `\skip_horizontal:N \c_zero_dim` is to prevent a potential `\unskip` to delete the `\leaders`¹

```

237   \skip_horizontal:N \c_zero_dim
238 }
```

Our `\everycr` has been modified. In particular, the creation of the `row` node is in the `\everycr` (maybe we should put it with the incrementation of `\c@iRow`). Since the following `\cr` correspond to a “false row”, we have to nullify `\everycr`.

```

239   \everycr { }
240   \cr
241   \noalign { \skip_vertical:N -\arrayrulewidth }
242 }
```

The following version of `\cline` spreads the array of a quantity equal to `\arrayrulewidth` as does `\hline`. It will be loaded excepted if the key `standard-cline` has been used.

```

243 \cs_set:Npn \@@_cline
```

We have to act in a fully expandable way since there may be `\noalign` (in the `\multispan`) to detect. That’s why we use `\@@_cline_i:en`.

```

244 { \@@_cline_i:en \l_@@_first_col_int }
```

The command `\cline_i:nn` has two arguments. The first is the number of the current column (it *must* be used in that column). The second is a standard argument of `\cline` of the form *i-j* or the form *i*.

```

245 \cs_set:Npn \@@_cline_i:nn #1 #2 { \@@_cline_i:w #1|#2- \q_stop }
246 \cs_set:Npn \@@_cline_i:w #1|#2-#3 \q_stop
247 {
```

¹See question 99041 on TeX StackExchange.

```

248     \tl_if_empty:nTF { #3 }
249     { \@@_cline_iii:w #1|#2-#2 \q_stop }
250     { \@@_cline_ii:w #1|#2-#3 \q_stop }
251   }
252 \cs_set:Npn \@@_cline_ii:w #1|#2-#3-\q_stop
253   { \@@_cline_iii:w #1|#2-#3 \q_stop }
254 \cs_set:Npn \@@_cline_iii:w #1|#2-#3 \q_stop
255   {

```

Now, #1 is the number of the current column and we have to draw a line from the column #2 to the column #3 (both included).

```

256   \int_compare:nNnT { #1 } < { #2 }
257     { \multispan { \int_eval:n { #2 - #1 } } & }
258   \multispan { \int_eval:n { #3 - #2 + 1 } }
259   {
260     \CT@arc@%
261     \leaders \hrule \height \arrayrulewidth \hfill
262     \skip_horizontal:N \c_zero_dim
263   }

```

You look whether there is another `\cline` to draw (the final user may put several `\cline`).

```

264   \peek_meaning_remove_ignore_spaces:NTF \cline
265   { & \@@_cline_i:en { \int_eval:n { #3 + 1 } } }
266   { \everycr { } \cr }
267 }
268 \cs_generate_variant:Nn \@@_cline_i:nn { e n }

```

The following command will be nullified in the environment `{NiceTabular}`, `{NiceTabular*}` and `{NiceTabularX}`.

```
269 \cs_set_eq:NN \@@_math_toggle: \c_math_toggle_token
```

```

270 \cs_new_protected:Npn \@@_set_CT@arc@:n #1
271   {
272     \tl_if_blank:nF { #1 }
273     {

302       {
303         \char_set_catcode_other:N >
304         \char_set_catcode_other:N <
305       }
306       #1
307   }

```

5 Parameters

The following counter will count the environments `{NiceArray}`. The value of this counter will be used to prefix the names of the Tikz nodes created in the array.

```
308 \int_new:N \g_@@_env_int
```

The following command is only a syntactic shortcut. It must *not* be protected (it will be used in names of PGF nodes).

```
309 \cs_new:Npn \@@_env: { \int_use:N \g_@@_env_int }
```

The command `\NiceMatrixLastEnv` is not used by the package `nicematrix`. It's only a facility given to the final user. It gives the number of the last environment (in fact the number of the current environment but it's meant to be used after the environment in order to refer to that environment — and its nodes — without having to give it a name). This command *must* be expandable since it will be used in pgf nodes.

```

310 \NewExpandableDocumentCommand \NiceMatrixLastEnv { }
311   { \int_use:N \g_@@_env_int }
```

The following command is only a syntactic shortcut. The `q` in `qpoint` means *quick*.

```

312 \cs_new_protected:Npn \@@_qpoint:n #1
313   { \pgfpointanchor { \@@_env: - #1 } { center } }
```

If the user uses `{NiceTabular}`, `{NiceTabular*}` or `{NiceTabularX}`, we will raise the following flag.

```
314 \bool_new:N \l_@@_tabular_bool
```

`\g_@@_delims_bool` will be true for the environments with delimiters (ex. : `{pNiceMatrix}`, `{pNiceArray}`, `\pAutoNiceMatrix`, etc.).

```

315 \bool_new:N \g_@@_delims_bool
316 \bool_gset_true:N \g_@@_delims_bool
```

In fact, if there is delimiters in the preamble of `{NiceArray}` (eg: `[cccc]`), this boolean will be set to false.

The following boolean will be equal to `true` in the environments which have a preamble (provided by the final user): `{NiceTabular}`, `{NiceArray}`, `{pNiceArray}`, etc.

```
317 \bool_new:N \l_@@_preamble_bool
318 \bool_set_true:N \l_@@_preamble_bool
```

We need a special treatment for `{NiceMatrix}` when `vlines` is not used, in order to retrieve `\arraycolsep` on both sides.

```
319 \bool_new:N \l_@@_NiceMatrix_without_vlines_bool
```

The following counter will count the environments `{NiceMatrixBlock}`.

```
320 \int_new:N \g_@@_NiceMatrixBlock_int
```

It's possible to put tabular notes (with `\tabularnote`) in the caption if that caption is composed *above* the tabular. In such case, we will count in `\g_@@_notes_caption_int` the number of uses of the command `\tabularnote` *without optional argument* in that caption.

```
321 \int_new:N \g_@@_notes_caption_int
```

The dimension `\l_@@_columns_width_dim` will be used when the options specify that all the columns must have the same width (but, if the key `columns-width` is used with the special value `auto`, the boolean `\l_@@_auto_columns_width_bool` also will be raised).

```
322 \dim_new:N \l_@@_columns_width_dim
```

The dimension `\l_@@_col_width_dim` will be available in each cell which belongs to a column of fixed width: `w{...}{...}`, `W{...}{...}`, `p{...}`, `m{...}`, `b{...}` but also `X` (when the actual width of that column is known, that is to say after the first compilation). It's the width of that column. It will be used by some commands `\Block`. A non positive value means that the column has no fixed width (it's a column of type `c`, `r`, `l`, etc.).

```
323 \dim_new:N \l_@@_col_width_dim
324 \dim_set:Nn \l_@@_col_width_dim { -1 cm }
```

The following counters will be used to count the numbers of rows and columns of the array.

```
325 \int_new:N \g_@@_row_total_int
326 \int_new:N \g_@@_col_total_int
```

The following parameter will be used by `\@@_create_row_node`: to avoid to create the same row-node twice (at the end of the array).

```
327 \int_new:N \g_@@_last_row_node_int
```

The following counter corresponds to the key `nb-rows` of the command `\RowStyle`.

```
328 \int_new:N \l_@@_key_nb_rows_int
```

The following token list will contain the type of horizontal alignment of the current cell as provided by the corresponding column. The possible values are `r`, `l`, `c` and `j`. For example, a column `p[1]{3cm}` will provide the value `l` for all the cells of the column.

```
329 \tl_new:N \l_@@_hpos_cell_tl
330 \tl_set_eq:NN \l_@@_hpos_cell_tl \c_@@_c_tl
```

When there is a mono-column block (created by the command `\Block`), we want to take into account the width of that block for the width of the column. That's why we compute the width of that block in the `\g_@@_blocks_wd_dim` and, after the construction of the box `\l_@@_cell_box`, we change the width of that box to take into account the length `\g_@@_blocks_wd_dim`.

```
331 \dim_new:N \g_@@_blocks_wd_dim
```

Idem for the mono-row blocks.

```
332 \dim_new:N \g_@@_blocks_ht_dim  
333 \dim_new:N \g_@@_blocks_dp_dim
```

The following dimension correspond to the key `width` (which may be fixed in `\NiceMatrixOptions` but also in an environment `{NiceTabular}`).

```
334 \dim_new:N \l_@@_width_dim
```

The sequence `\g_@@_names_seq` will be the list of all the names of environments used (via the option `name`) in the document: two environments must not have the same name. However, it's possible to use the option `allow-duplicate-names`.

```
335 \seq_new:N \g_@@_names_seq
```

We want to know whether we are in an environment of `nicematrix` because we will raise an error if the user tries to use nested environments.

```
336 \bool_new:N \l_@@_in_env_bool
```

The following key corresponds to the key `notes/detect_duplicates`.

```
337 \bool_new:N \l_@@_notes_detect_duplicates_bool  
338 \bool_set_true:N \l_@@_notes_detect_duplicates_bool
```

If the user uses `{NiceTabular*}`, the width of the tabular (in the first argument of the environment `{NiceTabular*}`) will be stored in the following dimension.

```
339 \dim_new:N \l_@@_tabular_width_dim
```

The following dimension will be used for the total width of composite rules (*total* means that the spaces on both sides are included).

```
340 \dim_new:N \l_@@_rule_width_dim
```

The key `color` in a command of rule such as `\Hline` (or the specifier “|” in the preamble of an environment).

```
341 \tl_new:N \l_@@_rule_color_tl
```

The following boolean will be raised when the command `\rotate` is used.

```
342 \bool_new:N \g_@@_rotate_bool
```

The following boolean will be raise then the command `\rotate` is used with the key `c`.

```
343 \bool_new:N \g_@@_rotate_c_bool
```

In a cell, it will be possible to know whether we are in a cell of a column of type `X` thanks to that flag.

```
344 \bool_new:N \l_@@_X_bool  
345 \bool_new:N \g_@@_caption_finished_bool
```

We will write in `\g_@@_aux_tl` all the instructions that we have to write on the `aux` file for the current environment. The contain of that token list will be written on the `aux` file at the end of the environment (in an instruction `\tl_gset:cn { c_@@_ \int_use:N \g_@@_env_int _ tl }`).

```
346 \tl_new:N \g_@@_aux_tl
```

During the second run, if informations concerning the current environment has been found in the `aux` file, the following flag will be raised.

```
347 \bool_new:N \g_@@_aux_found_bool
```

In particular, in that `aux` file, there will be, for each environment of `nicematrix`, an affectation for the the following sequence that will contain informations about the size of the array.

```
348 \seq_new:N \g_@@_size_seq

349 \tl_new:N \g_@@_left_delim_tl
350 \tl_new:N \g_@@_right_delim_tl
```

The token list `\g_@@_user_preamble_tl` will contain the preamble provided by the the final user of `nicematrix` (eg the preamble of an environment `{NiceTabular}`).

```
351 \tl_new:N \g_@@_user_preamble_tl
```

The token list `\g_@@_array_preamble_tl` will contain the preamble constructed by `nicematrix` for the environment `{array}` (of array).

```
352 \tl_new:N \g_@@_array_preamble_tl
```

For `\multicolumn`.

```
353 \tl_new:N \g_@@_preamble_tl
```

The following parameter corresponds to the key `columns-type` of the environments `{NiceMatrix}`, `{pNiceMatrix}`, etc. and also the key `matrix / columns-type` of `\NiceMatrixOptions`.

```
354 \tl_new:N \l_@@_columns_type_tl
355 \str_set:Nn \l_@@_columns_type_tl { c }
```

The following parameters correspond to the keys `down`, `up` and `middle` of a command such as `\Cdots`. Usually, the final user doesn't use that keys directly because he uses the syntax with the embellishments `_`, `^` and `:`.

```
356 \tl_new:N \l_@@_xdots_down_tl
357 \tl_new:N \l_@@_xdots_up_tl
358 \tl_new:N \l_@@_xdots_middle_tl
```

We will store in the following sequence informations provided by the instructions `\rowlistcolors` in the main array (not in the `\CodeBefore`).

```
359 \seq_new:N \g_@@_rowlistcolors_seq
```

```
360 \cs_new_protected:Npn \@@_test_if_math_mode:
  {
    \if_mode_math: \else:
      \@@_fatal:n { Outside~math~mode }
    \fi:
  }
```

The list of the columns where vertical lines in sub-matrices (`vlism`) must be drawn. Of course, the actual value of this sequence will be known after the analyse of the preamble of the array.

```
366 \seq_new:N \g_@@_cols_vlism_seq
```

The following colors will be used to memorize the color of the potential “first col” and the potential “first row”.

```
367 \colorlet{nicematrix-last-col}{.}
368 \colorlet{nicematrix-last-row}{.}
```

The following string is the name of the current environment or the current command of `nicematrix` (despite its name which contains `env`).

```
369 \str_new:N \g_@@_name_env_str
```

The following string will contain the word `command` or `environment` whether we are in a command of `nicematrix` or in an environment of `nicematrix`. The default value is `environment`.

```
370 \tl_new:N \g_@@_com_or_env_str
371 \tl_gset:Nn \g_@@_com_or_env_str { environment }
```

```
372 \bool_new:N \l_@@_bold_row_style_bool
```

The following command will be able to reconstruct the full name of the current command or environment (despite its name which contains `env`). This command must *not* be protected since it will be used in error messages and we have to use `\str_if_eq:VnTF` and not `\tl_if_eq:NnTF` because we need to be fully expandable).

```
373 \cs_new:Npn \@@_full_name_env:
374 {
375   \str_if_eq:VnTF \g_@@_com_or_env_str { command }
376     { command \space \c_backslash_str \g_@@_name_env_str }
377   { environment \space \{ \g_@@_name_env_str \} }
378 }
```

For the key `code` of the command `\SubMatrix` (itself in the main `\CodeAfter`), we will use the following token list.

```
379 \tl_new:N \l_@@_code_tl
```

For the key `pgf-node-code`. That code will be used when the nodes of the cells (that is to say the nodes of the form $i-j$) will be created.

```
380 \tl_new:N \l_@@_pgf_node_code_tl
```

The so-called `\CodeBefore` is splitted in two parts because we want to control the order of execution of some instructions.

```
381 \tl_new:N \g_@@_pre_code_before_tl
382 \tl_new:N \g_nicematrix_code_before_tl
```

The value of the key `code-before` will be added to the left of `\g_@@_pre_code_before_tl`. Idem for the code between `\CodeBefore` and `\Body`.

The so-called `\CodeAfter` is splitted in two parts because we want to control the order of execution of some instructions.

```
383 \tl_new:N \g_@@_pre_code_after_tl
384 \tl_new:N \g_nicematrix_code_after_tl
```

The `\CodeAfter` provided by the final user (with the key `code-after` or the keyword `\CodeAfter`) will be stored in the second token list.

```
385 \bool_new:N \l_@@_in_code_after_bool
```

The counters `\l_@@_old_iRow_int` and `\l_@@_old_jCol_int` will be used to save the values of the potential LaTeX counters `iRow` and `jCol`. These LaTeX counters will be restored at the end of the environment.

```
386 \int_new:N \l_@@_old_iRow_int
387 \int_new:N \l_@@_old_jCol_int
```

The TeX counters `\c@iRow` and `\c@jCol` will be created in the beginning of `{NiceArrayWithDelims}` (if they don't exist previously).

The following sequence will contain the names (without backslash) of the commands created by `custom-line` by the key `command` or `ccommand` (commands used by the final user in order to draw horizontal rules).

```
388 \seq_new:N \l_@@_custom_line_commands_seq
```

The following token list corresponds to the key `rules/color` available in the environments.

```
389 \tl_new:N \l_@@_rules_color_tl
```

The sum of the weights of all the X-columns in the preamble. The weight of a X-column is given as an optional argument between square brackets. The default value, of course, is 1.

```
390 \int_new:N \g_@@_total_X_weight_int
```

If there is at least one X-column in the preamble of the array, the following flag will be raised via the aux file. The length `\l_@@_x_columns_dim` will be the width of X-columns of weight 1 (the width of a column of weight n will be that dimension multiplied by n). That value is computed after the construction of the array during the first compilation in order to be used in the following run.

```
391 \bool_new:N \l_@@_X_columns_aux_bool
392 \dim_new:N \l_@@_X_columns_dim
```

This boolean will be used only to detect in an expandable way whether we are at the beginning of the (potential) column zero, in order to raise an error if `\Hdotsfor` is used in that column.

```
393 \bool_new:N \g_@@_after_col_zero_bool
```

A kind of false row will be inserted at the end of the array for the construction of the `col` nodes (and also to fix the width of the columns when `columns-width` is used). When this special row will be created, we will raise the flag `\g_@@_row_of_col_done_bool` in order to avoid some actions set in the redefinition of `\everycr` when the last `\cr` of the `\halign` will occur (after that row of `col` nodes).

```
394 \bool_new:N \g_@@_row_of_col_done_bool
```

It's possible to use the command `\NotEmpty` to specify explicitly that a cell must be considered as non empty by `nicematrix` (the Tikz nodes are constructed only in the non empty cells).

```
395 \bool_new:N \g_@@_not_empty_cell_bool
```

`\l_@@_code_before_t1` may contain two types of informations:

- A `code-before` written in the aux file by a previous run. When the aux file is read, this `code-before` is stored in `\g_@@_code_before_i_t1` (where i is the number of the environment) and, at the beginning of the environment, it will be put in `\l_@@_code_before_t1`.
- The final user can explicitly add material in `\l_@@_code_before_t1` by using the key `code-before` or the keyword `\CodeBefore` (with the keyword `\Body`).

```
396 \tl_new:N \l_@@_code_before_t1
397 \bool_new:N \l_@@_code_before_bool
```

The following token list will contain the code inserted in each cell of the current row (this token list will be cleared at the beginning of each row).

```
398 \tl_new:N \g_@@_row_style_t1
```

The following dimensions will be used when drawing the dotted lines.

```
399 \dim_new:N \l_@@_x_initial_dim
400 \dim_new:N \l_@@_y_initial_dim
401 \dim_new:N \l_@@_x_final_dim
402 \dim_new:N \l_@@_y_final_dim
```

The L3 programming layer provides scratch dimensions `\l_tmpa_dim` and `\l_tmpb_dim`. We creates two more in the same spirit.

```
403 \dim_zero_new:N \l_@@_tmpc_dim
404 \dim_zero_new:N \l_@@_tmpd_dim
```

Some cells will be declared as “empty” (for example a cell with an instruction `\Cdots`).

```
405 \bool_new:N \g_@@_empty_cell_bool
```

The following dimensions will be used internally to compute the width of the potential “first column” and “last column”.

```
406 \dim_new:N \g_@@_width_last_col_dim
407 \dim_new:N \g_@@_width_first_col_dim
```

The following sequence will contain the characteristics of the blocks of the array, specified by the command `\Block`. Each block is represented by 6 components surrounded by curly braces: `{imin}{jmin}{imax}{jmax}{options}{contents}`.

The variable is global because it will be modified in the cells of the array.

```
408 \seq_new:N \g_@@_blocks_seq
```

We also manage a sequence of the *positions* of the blocks. In that sequence, each block is represented by only five components: `{imin}{jmin}{imax}{jmax}{ name}`. A block with the key `hvlines` won't appear in that sequence (otherwise, the lines in that block would not be drawn!).

```
409 \seq_new:N \g_@@_pos_of_blocks_seq
```

In fact, this sequence will also contain the positions of the cells with a `\diagbox`. The sequence `\g_@@_pos_of_blocks_seq` will be used when we will draw the rules (which respect the blocks).

We will also manage a sequence for the positions of the dotted lines. These dotted lines are created in the array by `\Cdots`, `\Vdots`, `\Ddots`, etc. However, their positions, that is to say, their extremities, will be determined only after the construction of the array. In this sequence, each item contains five components: `{imin}{jmin}{imax}{jmax}{ name}`.

```
410 \seq_new:N \g_@@_pos_of_xdots_seq
```

The sequence `\g_@@_pos_of_xdots_seq` will be used when we will draw the rules required by the key `hvlines` (these rules won't be drawn within the virtual blocks corresponding to the dotted lines).

The final user may decide to “stroke” a block (using, for example, the key `draw=red!15` when using the command `\Block`). In that case, the rules specified, for instance, by `hvlines` must not be drawn around the block. That's why we keep the information of all that stroken blocks in the following sequence.

```
411 \seq_new:N \g_@@_pos_of_stroken_blocks_seq
```

If the user has used the key `corners`, all the cells which are in an (empty) corner will be stored in the following sequence.

```
412 \seq_new:N \l_@@_corners_cells_seq
```

The list of the names of the potential `\SubMatrix` in the `\CodeAfter` of an environment. Unfortunately, that list has to be global (we have to use it inside the group for the options of a given `\SubMatrix`).

```
413 \seq_new:N \g_@@_submatrix_names_seq
```

The following flag will be raised if the key `width` is used in an environment `{NiceTabular}` (not in a command `\NiceMatrixOptions`). You use it to raise an error when this key is used while no column X is used.

```
414 \bool_new:N \l_@@_width_used_bool
```

The sequence `\g_@@_multicolumn_cells_seq` will contain the list of the cells of the array where a command `\multicolumn{n}{...}{...}` with $n > 1$ is issued. In `\g_@@_multicolumn_sizes_seq`, the “sizes” (that is to say the values of n) correspondant will be stored. These lists will be used for the creation of the “medium nodes” (if they are created).

```
415 \seq_new:N \g_@@_multicolumn_cells_seq
```

```
416 \seq_new:N \g_@@_multicolumn_sizes_seq
```

The following counters will be used when searching the extremities of a dotted line (we need these counters because of the potential “open” lines in the `\SubMatrix`—the `\SubMatrix` in the `code-before`).

```
417 \int_new:N \l_@@_row_min_int
```

```
418 \int_new:N \l_@@_row_max_int
```

```
419 \int_new:N \l_@@_col_min_int
```

```
420 \int_new:N \l_@@_col_max_int
```

The following counters will be used when drawing the rules.

```

421 \int_new:N \l_@@_start_int
422 \int_set_eq:NN \l_@@_start_int \c_one_int
423 \int_new:N \l_@@_end_int
424 \int_new:N \l_@@_local_start_int
425 \int_new:N \l_@@_local_end_int

```

The following sequence will be used when the command `\SubMatrix` is used in the `\CodeBefore` (and not in the `\CodeAfter`). It will contain the position of all the sub-matrices specified in the `\CodeBefore`. Each sub-matrix is represented by an “object” of the form $\{i\}\{j\}\{k\}\{l\}$ where i and j are the number of row and column of the upper-left cell and k and l the number of row and column of the lower-right cell.

```
426 \seq_new:N \g_@@_submatrix_seq
```

We are able to determine the number of columns specified in the preamble (for the environments with explicit preamble of course and without the potential exterior columns).

```
427 \int_new:N \g_@@_static_num_of_col_int
```

The following parameters correspond to the keys `fill`, `opacity`, `draw`, `tikz`, `borders`, and `rounded-corners` of the command `\Block`.

```

428 \tl_new:N \l_@@_fill_tl
429 \tl_new:N \l_@@_opacity_tl
430 \tl_new:N \l_@@_draw_tl
431 \seq_new:N \l_@@_tikz_seq
432 \clist_new:N \l_@@_borders_clist
433 \dim_new:N \l_@@_rounded_corners_dim

```

The last parameter has no direct link with the [empty] corners of the array (which are computed and taken into account by `nicematrix` when the key `corners` is used).

The following dimension corresponds to the key `rounded-corners` available in an individual environment `{NiceTabular}`. When that key is used, a clipping is applied in the `\CodeBefore` of the environment in order to have rounded corners for the potential colored panels.

```
434 \dim_new:N \l_@@_tab_rounded_corners_dim
```

The following token list correspond to the key `color` of the command `\Block` and also the key `color` of the command `\RowStyle`.

```
435 \tl_new:N \l_@@_color_tl
```

In the key `tikz` of a command `\Block` or in the argument of a command `\TikzEveryCell`, the final user puts a list of tikz keys. But, you have added another key, named `offset` (which means that an offset will be used for the frame of the block or the cell). The following parameter corresponds to that key.

```
436 \dim_new:N \l_@@_offset_dim
```

Here is the dimension for the width of the rule when a block (created by `\Block`) is stroked.

```
437 \dim_new:N \l_@@_line_width_dim
```

The parameters of the horizontal position of the label of a block. If the user uses the key `c` or `C`, the value is `c`. If the user uses the key `l` or `L`, the value is `l`. If the user uses the key `r` or `R`, the value is `r`. If the user has used a capital letter, the boolean `\l_@@_hpos_of_block_cap_bool` will be raised (in the second pass of the analyze of the keys of the command `\Block`).

```

438 \str_new:N \l_@@_hpos_block_str
439 \str_set:Nn \l_@@_hpos_block_str { c }
440 \bool_new:N \l_@@_hpos_of_block_cap_bool

```

If the final user has used the special color “`nocolor`”, the following flag will be raised.

```
441 \bool_new:N \c@_nocolor_used_bool
```

For the vertical position, the possible values are `c`, `t` and `b`.

```

442 \str_new:N \l_@@_vpos_block_str
443 \str_set:Nn \l_@@_vpos_block_str { c }

```

Used when the key `draw-first` is used for `\Ddots` or `\Idots`.

```
444 \bool_new:N \l_@@_draw_first_bool
```

The following flag corresponds to the keys `vlines` and `hlines` of the command `\Block` (the key `hvlines` is the conjunction of both).

```
445 \bool_new:N \l_@@_vlines_block_bool  
446 \bool_new:N \l_@@_hlines_block_bool
```

The blocks which use the key `-` will store their content in a box. These boxes are numbered with the following counter.

```
447 \int_new:N \g_@@_block_box_int  
  
448 \dim_new:N \l_@@_submatrix_extra_height_dim  
449 \dim_new:N \l_@@_submatrix_left_xshift_dim  
450 \dim_new:N \l_@@_submatrix_right_xshift_dim  
451 \clist_new:N \l_@@_hlines_clist  
452 \clist_new:N \l_@@_vlines_clist  
453 \clist_new:N \l_@@_submatrix_hlines_clist  
454 \clist_new:N \l_@@_submatrix_vlines_clist
```

The following key is set when the keys `hvlines` and `hvlines-except-borders` are used. It's used only to change slightly the clipping path set by the key `rounded-corners` (for a `{tabular}`).

```
455 \bool_new:N \l_@@_hvlines_bool
```

The following flag will be used by (for instance) `\@@_vline_ii`. When `\l_@@_dotted_bool` is `true`, a dotted line (with our system) will be drawn.

```
456 \bool_new:N \l_@@_dotted_bool
```

The following flag will be set to true during the composition of a caption specified (by the key `caption`).

```
457 \bool_new:N \l_@@_in_caption_bool
```

Variables for the exterior rows and columns

The keys for the exterior rows and columns are `first-row`, `first-col`, `last-row` and `last-col`. However, internally, these keys are not coded in a similar way.

- **First row**

The integer `\l_@@_first_row_int` is the number of the first row of the array. The default value is 1, but, if the option `first-row` is used, the value will be 0.

```
458 \int_new:N \l_@@_first_row_int  
459 \int_set:Nn \l_@@_first_row_int 1
```

- **First column**

The integer `\l_@@_first_col_int` is the number of the first column of the array. The default value is 1, but, if the option `first-col` is used, the value will be 0.

```
460 \int_new:N \l_@@_first_col_int  
461 \int_set_eq:NN \l_@@_first_col_int \c_one_int
```

- **Last row**

The counter `\l_@@_last_row_int` is the number of the potential “last row”, as specified by the key `last-row`. A value of `-2` means that there is no “last row”. A value of `-1` means that there is a “last row” but we don't know the number of that row (the key `last-row` has been used without value and the actual value has not still been read in the `aux` file).

```
462 \int_new:N \l_@@_last_row_int  
463 \int_set:Nn \l_@@_last_row_int { -2 }
```

If, in an environment like `{pNiceArray}`, the option `last-row` is used without value, we will globally raise the following flag. It will be used to know if we have, after the construction of the array, to write in the `aux` file the number of the “last row”.²

```
464 \bool_new:N \l_@@_last_row_without_value_bool
```

Idem for `\l_@@_last_col_without_value_bool`

```
465 \bool_new:N \l_@@_last_col_without_value_bool
```

- **Last column**

For the potential “last column”, we use an integer. A value of `-2` means that there is no last column. A value of `-1` means that we are in an environment without preamble (e.g. `{bNiceMatrix}`) and there is a last column but we don’t know its value because the user has used the option `last-col` without value. A value of `0` means that the option `last-col` has been used in an environment with preamble (like `{pNiceArray}`): in this case, the key was necessary without argument. The command `\NiceMatrixOptions` also sets `\l_@@_last_col_int` to `0`.

```
466 \int_new:N \l_@@_last_col_int
467 \int_set:Nn \l_@@_last_col_int { -2 }
```

However, we have also a boolean. Consider the following code:

```
\begin{pNiceArray}[cc][last-col]
 1 & 2 \\
 3 & 4
\end{pNiceArray}
```

In such a code, the “last column” specified by the key `last-col` is not used. We want to be able to detect such a situation and we create a boolean for that job.

```
468 \bool_new:N \g_@@_last_col_found_bool
```

This boolean is set to `false` at the end of `\@@_pre_array_ii`:

In the last column, we will raise the following flag (it will be used by `\OnlyMainNiceMatrix`).

```
469 \bool_new:N \l_@@_in_last_col_bool
```

Some utilities

```
470 \cs_set_protected:Npn \@@_cut_on_hyphen:w #1-#2\q_stop
471 {
472   \cs_set_nopar:Npn \l_tmpa_tl { #1 }
473   \cs_set_nopar:Npn \l_tmpb_tl { #2 }
474 }
```

The following takes as argument the name of a `clist` and which should be a list of intervals of integers. It *expands* that list, that is to say, it replaces (by a sort of `mapcan` or `flat_map`) the interval by the explicit list of the integers.

```
475 \cs_new_protected:Npn \@@_expand_clist:N #1
476 {
477   \clist_if_in:NVF #1 \c_@@_all_tl
478   {
479     \clist_clear:N \l_tmpa_clist
480     \clist_map_inline:Nn #1
```

²We can’t use `\l_@@_last_row_int` for this usage because, if `nicematrix` has read its value from the `aux` file, the value of the counter won’t be `-1` any longer.

```

481      {
482        \tl_if_in:nnTF { ##1 } { - }
483        { \c@_cut_on_hyphen:w ##1 \q_stop }
484        {
485          \cs_set_nopar:Npn \l_tmpa_tl { ##1 }
486          \cs_set_nopar:Npn \l_tmpb_tl { ##1 }
487        }
488        \int_step_inline:nnn { \l_tmpa_tl } { \l_tmpb_tl }
489        { \clist_put_right:Nn \l_tmpa_clist { #####1 } }
490      }
491      \tl_set_eq:NN #1 \l_tmpa_clist
492    }
493  }

```

The following internal parameters are for:

- `\Ldots` with both extremities open (and hence also `\Hdotsfor` in an exterior row);
- `\Vdots` with both extremities open (and hence also `\Vdotsfor` in an exterior column);
- when the special character “.” is used in order to put the label of a so-called “dotted line” *on the line*, a margin of `\c_@@_innersep_middle_dim` will be added around the label.

```

494 \hook_gput_code:nnn { begindocument } { . }
495  {
496    \dim_const:Nn \c_@@_shift_Ldots_last_row_dim { 0.5 em }
497    \dim_const:Nn \c_@@_shift_exterior_Vdots_dim { 0.6 em }
498    \dim_const:Nn \c_@@_innersep_middle_dim { 0.17 em }
499  }

```

6 The command `\tabularnote`

Of course, it's possible to use `\tabularnote` in the main tabular. But there is also the possibility to use that command in the caption of the tabular. And the caption may be specified by two means:

- The caption may of course be provided by the command `\caption` in a floating environment. Of course, a command `\tabularnote` in that `\caption` makes sens only if the `\caption` is *before* the `{tabular}`.
- It's also possible to use `\tabularnote` in the value of the key `caption` of the `{NiceTabular}` when the key `caption-above` is in force. However, in that case, one must remind that the caption is composed *after* the composition of the box which contains the main tabular (that's mandatory since that caption must be wrapped with a line width equal to the width of the tabular). However, we want the labels of the successive tabular notes in the logical order. That's why:
 - The number of tabular notes present in the caption will be written on the `aux` file and available in `\g_@@_notes_caption_int`.³
 - During the composition of the main tabular, the tabular notes will be numbered from `\g_@@_notes_caption_int+1` and the notes will be stored in `\g_@@_notes_seq`. Each component of `\g_@@_notes_seq` will be a kind of couple of the form : `{label}{text of the tabularnote}`. The first component is the optional argument (between square brackets) of the command `\tabularnote` (if the optional argument is not used, the value will be the special marker expressed by `\c_novalue_t1`).

³More precisely, it's the number of tabular notes which do not use the optional argument of `\tabularnote`.

- During the composition of the caption (value of `\l_@@_caption_tl`), the tabular notes will be numbered from 1 to `\g_@@_notes_caption_int` and the notes themselves will be stored in `\g_@@_notes_in_caption_seq`. The structure of the components of that sequence will be the same as for `\g_@@_notes_seq`.
- After the composition of the main tabular and after the composition of the caption, the sequences `\g_@@_notes_in_caption_seq` and `\g_@@_notes_seq` will be merged (in that order) and the notes will be composed.

The LaTeX counter `tabularnote` will be used to count the tabular notes during the construction of the array (this counter won't be used during the composition of the notes at the end of the array). You use a LaTeX counter because we will use `\refstepcounter` in order to have the tabular notes referenceable.

```
500 \newcounter{tabularnote}
501 \seq_new:N \g_@@_notes_seq
502 \seq_new:N \g_@@_notes_in_caption_seq
```

Before the actual tabular notes, it's possible to put a text specified by the key `tabularnote` of the environment. The token list `\g_@@_tabularnote_tl` corresponds to the value of that key.

```
503 \tl_new:N \g_@@_tabularnote_tl
```

We prepare the tools for the formatting of the references of the footnotes (in the tabular itself). There may have several references of footnote at the same point and we have to take into account that point.

```
504 \seq_new:N \l_@@_notes_labels_seq
505 \newcounter{nicematrix_draft}
506 \cs_new_protected:Npn \@@_notes_format:n #1
507 {
508     \setcounter{nicematrix_draft}{#1}
509     \@@_notes_style:n {nicematrix_draft}
510 }
```

The following function can be redefined by using the key `notes/style`.

```
511 \cs_new:Npn \@@_notes_style:n #1 { \textit{ \alph{#1} } }
```

The following fonction can be redefined by using the key `notes/label-in-tabular`.

```
512 \cs_new:Npn \@@_notes_label_in_tabular:n #1 { \textsuperscript{#1} }
```

The following function can be redefined by using the key `notes/label-in-list`.

```
513 \cs_new:Npn \@@_notes_label_in_list:n #1 { \textsuperscript{#1} }
```

We define `\thetabularnote` because it will be used by LaTeX if the user want to reference a tabular which has been marked by a `\label`. The TeX group is for the case where the user has put an instruction such as `\color{red}` in `\@@_notes_style:n`.

```
514 \cs_set:Npn \thetabularnote { \@@_notes_style:n { tabularnote } }
```

The tabular notes will be available for the final user only when `enumitem` is loaded. Indeed, the tabular notes will be composed at the end of the array with a list customized by `enumitem` (a list `tabularnotes` in the general case and a list `tabularnotes*` if the key `para` is in force). However, we can test whether `enumitem` has been loaded only at the beginning of the document (we want to allow the user to load `enumitem` after `nicematrix`).

```
515 \hook_gput_code:nnn { begindocument } { . }
516 {
517     \IfPackageLoadedTF { enumitem }
518     {
```

The type of list `tabularnotes` will be used to format the tabular notes at the end of the array in the general case and `tabularnotes*` will be used if the key `para` is in force.

```

519      \newlist { tabularnotes } { enumerate } { 1 }
520      \setlist [ tabularnotes ]
521      {
522          topsep = Opt ,
523          noitemsep ,
524          leftmargin = * ,
525          align = left ,
526          labelsep = Opt ,
527          label =
528              \@@_notes_label_in_list:n { \@@_notes_style:n { tabularnotesi } } ,
529      }
530      \newlist { tabularnotes* } { enumerate* } { 1 }
531      \setlist [ tabularnotes* ]
532      {
533          afterlabel = \nobreak ,
534          itemjoin = \quad ,
535          label =
536              \@@_notes_label_in_list:n { \@@_notes_style:n { tabularnotes*i } }
537      }

```

One must remind that we have allowed a `\tabular` in the caption and that caption may also be found in the list of tables (`\listoftables`). We want the command `\tabularnote` be no-op during the composition of that list. That's why we program `\tabularnote` to be no-op excepted in a floating environment or in an environment of `nicematrix`.

```

538 \NewDocumentCommand \tabularnote { o m }
539 {
540     \bool_lazy_or:nnT { \cs_if_exist_p:N \captype } \l_@@_in_env_bool
541     {
542         \bool_lazy_and:nnTF { ! \l_@@_tabular_bool } \l_@@_in_env_bool
543         {
544             \error:n { tabularnote-forbidden }
545             {
546                 \bool_if:NTF \l_@@_in_caption_bool
547                     \@@_tabularnote_caption:nn
548                     \@@_tabularnote:nn
549                     { #1 } { #2 }
550             }
551         }
552     }
553     {
554         \NewDocumentCommand \tabularnote { o m }
555         {
556             \@@_error_or_warning:n { enumitem-not-loaded }
557             \@@_gredirect_none:n { enumitem-not-loaded }
558         }
559     }
560 }
561 \cs_new_protected:Npn \@@_test_first_novalue:nnn #1 #2 #3
562     { \tl_if_novalue:nT { #1 } { #3 } }

```

For the version in normal conditions, that is to say not in the `caption`. `#1` is the optional argument of `\tabularnote` (maybe equal to the special marker expressed by `\c_novalue_t1`) and `#2` is the mandatory argument of `\tabularnote`.

```

563 \cs_new_protected:Npn \@@_tabularnote:nn #1 #2
564     {

```

You have to see whether the argument of `\tabularnote` has yet been used as argument of another `\tabularnote` in the same tabular. In that case, there will be only one note (for both commands `\tabularnote`) at the end of the tabular. We search the argument of our command `\tabularnote`

in `\g_@@_notes_seq`. The position in the sequence will be stored in `\l_tmpa_int` (0 if the text is not in the sequence yet).

```
565     \int_zero:N \l_tmpa_int
566     \bool_if:NT \l_@@_notes_detect_duplicates_bool
567     {
```

We recall that each component of `\g_@@_notes_seq` is a kind of couple of the form

```
{label}{text of the tabularnote}.
```

If the user have used `\tabularnote` without the optional argument, the `label` will be the special marker expressed by `\c_novalue_tl`.

When we will go through the sequence `\g_@@_notes_seq`, we will count in `\l_tmpb_int` the notes without explicit label in order to have the “current” value of the counter `\c@tabularnote`.

```
568     \int_zero:N \l_tmpb_int
569     \seq_map_indexed_inline:Nn \g_@@_notes_seq
570     {
571         \@@_test_first_novalue:nnn ##2 { \int_incr:N \l_tmpb_int }
572         \tl_if_eq:nnT { { #1 } { #2 } } { ##2 }
573         {
574             \tl_if_novalue:nTF { #1 }
575             { \int_set_eq:NN \l_tmpa_int \l_tmpb_int }
576             { \int_set:Nn \l_tmpa_int { ##1 } }
577             \seq_map_break:
578         }
579     }
580     \int_if_zero:nF \l_tmpa_int
581     { \int_add:Nn \l_tmpa_int \g_@@_notes_caption_int }
582 }
583 \int_if_zero:nT \l_tmpa_int
584 {
585     \seq_gput_right:Nn \g_@@_notes_seq { { #1 } { #2 } }
586     \tl_if_novalue:nT { #1 } { \int_gincr:N \c@tabularnote }
587 }
588 \seq_put_right:Nx \l_@@_notes_labels_seq
589 {
590     \tl_if_novalue:nTF { #1 }
591     {
592         \@@_notes_format:n
593         {
594             \int_eval:n
595             {
596                 \int_if_zero:nTF \l_tmpa_int
597                     \c@tabularnote
598                     \l_tmpa_int
599             }
600         }
601     }
602     { #1 }
603 }
604 \peek_meaning:NF \tabularnote
605 {
```

If the following token is *not* a `\tabularnote`, we have finished the sequence of successive commands `\tabularnote` and we have to format the labels of these tabular notes (in the array). We compose those labels in a box `\l_tmpa_box` because we will do a special construction in order to have this box in an overlapping position if we are at the end of a cell when `\l_@@_hpos_cell_tl` is equal to `c` or `r`.

```
606     \hbox_set:Nn \l_tmpa_box
607     {
```

We remind that it is the command `\@@_notes_label_in_tabular:n` that will put the labels in a `\textsuperscript`.

```
608     \@@_notes_label_in_tabular:n
609     {
```

```

610           \seq_use:Nnnn
611             \l_@@_notes_labels_seq { , } { , } { , }
612           }
613       }

```

We want the (last) tabular note referenceable (with the standard command `\label`).

```

614   \int_gdecr:N \c@tabularnote
615   \int_set_eq:NN \l_tmpa_int \c@tabularnote
616   \refstepcounter{tabularnote}
617   \int_compare:nNnT \l_tmpa_int = \c@tabularnote
618     { \int_gincr:N \c@tabularnote }
619   \seq_clear:N \l_@@_notes_labels_seq
620   \bool_lazy_or:nnTF
621     { \tl_if_eq_p:NN \l_@@_hpos_cell_tl \c_@@_c_tl }
622     { \tl_if_eq_p:NN \l_@@_hpos_cell_tl \c_@@_r_tl }
623     {
624       \hbox_overlap_right:n { \box_use:N \l_tmpa_box }

```

If the command `\tabularnote` is used exactly at the end of the cell, the `\unskip` (inserted by `array`?) will delete the skip we insert now and the label of the footnote will be composed in an overlapping position (by design).

```

625   \skip_horizontal:n { \box_wd:N \l_tmpa_box }
626   }
627   { \box_use:N \l_tmpa_box }
628 }
629 }

```

Now the version when the command is used in the key `caption`. The main difficulty is that the argument of the command `\caption` is composed several times. In order to know the number of commands `\tabularnote` in the caption, we will consider that there should not be the same tabular note twice in the caption (in the main tabular, it's possible). Once we have found a tabular note which has yet been encountered, we consider that you are in a new composition of the argument of `\caption`.

```

630 \cs_new_protected:Npn \g_@@_tabularnote_caption:nn #1 #2
631 {
632   \bool_if:NTF \g_@@_caption_finished_bool
633   {
634     \int_compare:nNnT \c@tabularnote = \g_@@_notes_caption_int
635     { \int_gzero:N \c@tabularnote }

```

Now, we try to detect duplicate notes in the caption. Be careful! We must put `\tl_if_in:NnF` and not `\tl_if_in:NnT`!

```

636   \seq_if_in:NnF \g_@@_notes_in_caption_seq { { #1 } { #2 } }
637     { \@@_error:n { Identical~notes-in~caption } }
638   }
639   {

```

In the following code, we are in the first composition of the caption or at the first `\tabularnote` of the second composition.

```

640   \seq_if_in:NnTF \g_@@_notes_in_caption_seq { { #1 } { #2 } }
641     {

```

Now, we know that are in the second composition of the caption since we are reading a tabular note which has yet been read. Now, the value of `\g_@@_notes_caption_int` won't change anymore: it's the number of uses *without optional argument* of the command `\tabularnote` in the caption.

```

642   \bool_gset_true:N \g_@@_caption_finished_bool
643   \int_gset_eq:NN \g_@@_notes_caption_int \c@tabularnote
644   \int_gzero:N \c@tabularnote
645   }

7 Command for creation of rectangle nodes

The following command should be used in a `{pgfpicture}`. It creates a rectangle (empty but with a name).

#1 is the name of the node which will be created; #2 and #3 are the coordinates of one of the corner of the rectangle; #4 and #5 are the coordinates of the opposite corner.

```

664 \cs_new_protected:Npn \c@_pgf_rect_node:nnnn #1 #2 #3 #4 #5
665 {
666     \begin{pgfscope}
667         \pgfset
668         {
669             inner sep = \c_zero_dim ,
670             minimum size = \c_zero_dim
671         }
672         \pgftransformshift { \pgfpoint { 0.5 * ( #2 + #4 ) } { 0.5 * ( #3 + #5 ) } }
673         \pgfnode
674         {
675             rectangle
676             {
677                 center
678                 \vbox_to_ht:nn
679                 { \dim_abs:n { #5 - #3 } }
680                 {
681                     \vfill
682                     \hbox_to_wd:nn { \dim_abs:n { #4 - #2 } } { }
683                 }
684             }
685             {
686                 \end{pgfscope}
687             }
688         }
689     }

```

The command `\c@_pgf_rect_node:nnn` is a variant of `\c@_pgf_rect_node:nnnn`: it takes two PGF points as arguments instead of the four dimensions which are the coordinates.

```

688 \cs_new_protected:Npn \c@_pgf_rect_node:nnn #1 #2 #3
689 {
690     \begin{pgfscope}
691         \pgfset
692         {
693             inner sep = \c_zero_dim ,
694             minimum size = \c_zero_dim

```

```

695      }
696      \pgftransformshift { \pgfpointscale { 0.5 } { \pgfpointadd { #2 } { #3 } } }
697      \pgfpointdiff { #3 } { #2 }
698      \pgfgetlastxy \l_tmpa_dim \l_tmpb_dim
699      \pgfnode
700      { rectangle }
701      { center }
702      {
703        \vbox_to_ht:nn
704        { \dim_abs:n \l_tmpb_dim }
705        { \vfill \hbox_to_wd:nn { \dim_abs:n \l_tmpa_dim } { } }
706      }
707      { #1 }
708      { }
709      \end { pgfscope }
710
}

```

8 The options

The following parameter corresponds to the keys `caption`, `short-caption` and `label` of the environment `{NiceTabular}`.

```

711 \tl_new:N \l_@@_caption_tl
712 \tl_new:N \l_@@_short_caption_tl
713 \tl_new:N \l_@@_label_tl

```

The following parameter corresponds to the key `caption-above` of `\NiceMatrixOptions`. When this paremeter is `true`, the captions of the environments `{NiceTabular}`, specified with the key `caption` are put above the tabular (and below elsewhere).

```
714 \bool_new:N \l_@@_caption_above_bool
```

By default, the commands `\cellcolor` and `\rowcolor` are available for the user in the cells of the tabular (the user may use the commands provided by `\colortbl`). However, if the key `color-inside` is used, these commands are available.

```
715 \bool_new:N \l_@@_color_inside_bool
```

By default, the behaviour of `\cline` is changed in the environments of `nicematrix`: a `\cline` spreads the array by an amount equal to `\arrayrulewidth`. It's possible to disable this feature with the key `\l_@@_standard_line_bool`.

```
716 \bool_new:N \l_@@_standard_cline_bool
```

The following dimensions correspond to the options `cell-space-top-limit` and `co` (these parameters are inspired by the package `cellspace`).

```

717 \dim_new:N \l_@@_cell_space_top_limit_dim
718 \dim_new:N \l_@@_cell_space_bottom_limit_dim

```

The following parameter corresponds to the key `xdots/horizontal_labels`.

```
719 \bool_new:N \l_@@_xdots_h_labels_bool
```

The following dimension is the distance between two dots for the dotted lines (when `line-style` is equal to `standard`, which is the initial value). The initial value is 0.45 em but it will be changed if the option `small` is used.

```

720 \dim_new:N \l_@@_xdots_inter_dim
721 \hook_gput_code:nnn { begindocument } { . }
722   { \dim_set:Nn \l_@@_xdots_inter_dim { 0.45 em } }

```

The unit is `em` and that's why we fix the dimension after the preamble.

The following dimension is the distance between a node (in fact an anchor of that node) and a dotted line (for real dotted lines, the actual distance may, of course, be a bit larger, depending of the exact position of the dots).

```
723 \dim_new:N \l_@@_xdots_shorten_start_dim
724 \dim_new:N \l_@@_xdots_shorten_end_dim
725 \hook_gput_code:nnn { begindocument } { . }
726 {
727   \dim_set:Nn \l_@@_xdots_shorten_start_dim { 0.3 em }
728   \dim_set:Nn \l_@@_xdots_shorten_end_dim { 0.3 em }
729 }
```

The unit is `em` and that's why we fix the dimension after the preamble.

The following dimension is the radius of the dots for the dotted lines (when `line-style` is equal to `standard`, which is the initial value). The initial value is 0.53 pt but it will be changed if the option `small` is used.

```
730 \dim_new:N \l_@@_xdots_radius_dim
731 \hook_gput_code:nnn { begindocument } { . }
732 { \dim_set:Nn \l_@@_xdots_radius_dim { 0.53 pt } }
```

The unit is `em` and that's why we fix the dimension after the preamble.

The token list `\l_@@_xdots_line_style_tl` corresponds to the option `tikz` of the commands `\Cdots`, `\Ldots`, etc. and of the options `line-style` for the environments and `\NiceMatrixOptions`. The constant `\c_@@_standard_tl` will be used in some tests.

```
733 \tl_new:N \l_@@_xdots_line_style_tl
734 \tl_const:Nn \c_@@_standard_tl { standard }
735 \tl_set_eq:NN \l_@@_xdots_line_style_tl \c_@@_standard_tl
```

The boolean `\l_@@_light_syntax_bool` corresponds to the option `light-syntax` and the boolean `\l_@@_light_syntax_expanded_bool` correspond to the the option `light-syntax-expanded`.

```
736 \bool_new:N \l_@@_light_syntax_bool
737 \bool_new:N \l_@@_light_syntax_expanded_bool
```

The string `\l_@@_baseline_tl` may contain one of the three values `t`, `c` or `b` as in the option of the environment `{array}`. However, it may also contain an integer (which represents the number of the row to which align the array).

```
738 \tl_new:N \l_@@_baseline_tl
739 \tl_set:Nn \l_@@_baseline_tl { c }
```

The flag `\l_@@_exterior_arraycolsep_bool` corresponds to the option `exterior-arraycolsep`. If this option is set, a space equal to `\arraycolsep` will be put on both sides of an environment `{NiceArray}` (as it is done in `{array}` of `array`).

```
740 \bool_new:N \l_@@_exterior_arraycolsep_bool
```

The flag `\l_@@_parallelize_diags_bool` controls whether the diagonals are parallelized. The initial value is `true`.

```
741 \bool_new:N \l_@@_parallelize_diags_bool
742 \bool_set_true:N \l_@@_parallelize_diags_bool
```

The following parameter correspond to the key `corners`. The elements of that `clist` must be within `NW`, `SW`, `NE` and `SE`.

```
743 \clist_new:N \l_@@_corners_clist

744 \dim_new:N \l_@@_notes_above_space_dim
745 \hook_gput_code:nnn { begindocument } { . }
746 { \dim_set:Nn \l_@@_notes_above_space_dim { 1 mm } }
```

We use a hook only by security in case `revtex4-1` is used (even though it is obsolete).

The flag `\l_@@_nullify_dots_bool` corresponds to the option `nullify-dots`. When the flag is down, the instructions like `\vdots` are inserted within a `\phantom` (and so the constructed matrix has exactly the same size as a matrix constructed with the classical `{matrix}` and `\ldots`, `\vdots`, etc.).

```
747 \bool_new:N \l_@@_nullify_dots_bool
```

When the key `respect-arraystretch` is used, the following command will be nullified.

```
748 \cs_new_protected:Npn \c@_reset_arraystretch:
749   { \cs_set_nopar:Npn \arraystretch { 1 } }
```

The following flag will be used when the current options specify that all the columns of the array must have the same width equal to the largest width of a cell of the array (except the cells of the potential exterior columns).

```
750 \bool_new:N \l_@@_auto_columns_width_bool
```

The following boolean corresponds to the key `create-cell-nodes` of the keyword `\CodeBefore`.

```
751 \bool_new:N \g_@@_recreate_cell_nodes_bool
```

The string `\l_@@_name_str` will contain the optional name of the environment: this name can be used to access to the Tikz nodes created in the array from outside the environment.

```
752 \str_new:N \l_@@_name_str
```

The boolean `\l_@@_medium_nodes_bool` will be used to indicate whether the “medium nodes” are created in the array. Idem for the “large nodes”.

```
753 \bool_new:N \l_@@_medium_nodes_bool
754 \bool_new:N \l_@@_large_nodes_bool
```

The boolean `\l_@@_except_borders_bool` will be raised when the key `hvlines-except-borders` will be used (but that key has also other effects).

```
755 \bool_new:N \l_@@_except_borders_bool
```

The dimension `\l_@@_left_margin_dim` correspond to the option `left-margin`. Idem for the right margin. These parameters are involved in the creation of the “medium nodes” but also in the placement of the delimiters and the drawing of the horizontal dotted lines (`\hdottedline`).

```
756 \dim_new:N \l_@@_left_margin_dim
757 \dim_new:N \l_@@_right_margin_dim
```

The dimensions `\l_@@_extra_left_margin_dim` and `\l_@@_extra_right_margin_dim` correspond to the options `extra-left-margin` and `extra-right-margin`.

```
758 \dim_new:N \l_@@_extra_left_margin_dim
759 \dim_new:N \l_@@_extra_right_margin_dim
```

The token list `\l_@@_end_of_row_tl` corresponds to the option `end-of-row`. It specifies the symbol used to mark the ends of rows when the light syntax is used.

```
760 \tl_new:N \l_@@_end_of_row_tl
761 \tl_set:Nn \l_@@_end_of_row_tl { ; }
```

The following parameter is for the color the dotted lines drawn by `\cdots`, `\ldots`, `\vdots`, `\ddots`, `\iddots` and `\hdotsfor` but *not* the dotted lines drawn by `\hdottedline` and `:`.

```
762 \tl_new:N \l_@@_xdots_color_tl
```

The following token list corresponds to the key `delimiters/color`.

```
763 \tl_new:N \l_@@_delimiters_color_tl
```

Sometimes, we want to have several arrays vertically juxtaposed in order to have an alignment of the columns of these arrays. To achieve this goal, one may wish to use the same width for all the columns (for example with the option `columns-width` or the option `auto-columns-width` of the environment `{NiceMatrixBlock}`). However, even if we use the same type of delimiters, the width of the delimiters may be different from an array to another because the width of the delimiter is function of its size. That's why we create an option called `delimiters/max-width` which will give to the delimiters the width of a delimiter (of the same type) of big size. The following boolean corresponds to this option.

```

764 \bool_new:N \l_@@_delimiters_max_width_bool

765 \keys_define:nn { NiceMatrix / xdots }

1167 }
```

9 Important code used by `{NiceArrayWithDelims}`

The pseudo-environment `\@@_cell_begin:w-\@@_cell_end:` will be used to format the cells of the array. In the code, the affectations are global because this pseudo-environment will be used in the cells of a `\halign` (via an environment `{array}`).

```

1168 \cs_new_protected:Npn \@@_cell_begin:w
1169 {
```

`\g_@@_cell_after_hook_tl` will be set during the composition of the box `\l_@@_cell_box` and will be used *after* the composition in order to modify that box.

```
1170 \tl_gclear:N \g_@@_cell_after_hook_tl
```

At the beginning of the cell, we link `\CodeAfter` to a command which do begin with `\`` (whereas the standard version of `\CodeAfter` does not).

```
1171 \cs_set_eq:NN \CodeAfter \@@_CodeAfter_i:
```

We increment the LaTeX counter `jCol`, which is the counter of the columns.

```
1172 \int_gincr:N \c@jCol
```

Now, we increment the counter of the rows. We don't do this incrementation in the `\everycr` because some packages, like `arydshln`, create special rows in the `\halign` that we don't want to take into account.

```
1173 \int_compare:nNnT \c@jCol = \c_one_int
1174   { \int_compare:nNnT \l_@@_first_col_int = \c_one_int \@@_begin_of_row: }
```

The content of the cell is composed in the box `\l_@@_cell_box`. The `\hbox_set_end:` corresponding to this `\hbox_set:Nw` is in the `\@@_cell_end:`

```
1175 \hbox_set:Nw \l_@@_cell_box
```

The following command is nullified in the tabulars.

```
1176 \@@_tuning_not_tabular_begin:
1177 \@@_tuning_first_row:
1178 \@@_tuning_last_row:
1179 \g_@@_row_style_tl
1180 }
```

The following command will be nullified unless there is a first row.

```
1181 \cs_new_protected:Npn \@@_tuning_first_row:
1182 {
1183   \int_if_zero:nT \c@iRow
1184   {
1185     \int_compare:nNnT \c@jCol > \c_zero_int
1186     {
1187       \l_@@_code_for_first_row_tl
1188       \xglobal \colorlet{nicematrix-first-row}{.}
1189     }
1190   }
1191 }
```

The following command will be nullified unless there is a last row and we know its value (*i.e.* `\l_@@_lat_row_int > 0`).

```
1192 \cs_new_protected:Npn \@@_tuning_last_row:
1193 {
1194   \int_compare:nNnT \c@iRow = \l_@@_last_row_int
1195   {
1196     \l_@@_code_for_last_row_tl
1197     \xglobal \colorlet{nicematrix-last-row}{.}
1198   }
1199 }
```

A different value will be provided to the following command when the key `small` is in force.

```
1200 \cs_set_eq:NN \@@_tuning_key_small: \prg_do_nothing:
```

The following commands are nullified in the tabulars.

```
1201 \cs_set_nopar:Npn \@@_tuning_not_tabular_begin:

Remark: If the key `recreate-cell-nodes` of the `\CodeBefore` is used, then we will add some lines to that command.

The following code is used in each cell of the array. It actualises quantities that, at the end of the array, will give informations about the vertical dimension of the two first rows and the two last rows. If the user uses the `last-row`, some lines of code will be dynamically added to this command.

If the cell is empty, or may be considered as if, we must not create the PGF node, for two reasons:

- it’s a waste of time since such a node would be rather pointless;
- we test the existence of these nodes in order to determine whether a cell is empty when we search the extremities of a dotted line.

However, it's very difficult to determine whether a cell is empty. Up to now we use the following technic:

- for the columns of type p, m, b, V (of `varwidth`) or X, we test whether the cell is syntactically empty with `\@@_test_if_empty:` and `\@@_test_if_empty_for_S:`
- if the width of the box `\l_@@_cell_box` (created with the content of the cell) is equal to zero, we consider the cell as empty (however, this is not perfect since the user may have used a `\rlap`, `\llap`, `\clap` or a `\mathclap` of `mathtools`).
- the cells with a command `\Ldots` or `\Cdots`, `\Vdots`, etc., should also be considered as empty; if `nullify-dots` is in force, there would be nothing to do (in this case the previous commands only write an instruction in a kind of `\CodeAfter`); however, if `nullify-dots` is not in force, a phantom of `\ldots`, `\cdots`, `\vdots` is inserted and its width is not equal to zero; that's why these commands raise a boolean `\g_@@_empty_cell_bool` and we begin by testing this boolean.

```

1307 \bool_if:NTF \g_@@_empty_cell_bool

```

The second argument of the following command `\@@_instruction_of_type:nnn` defined below is the type of the instruction (`Cdots`, `Vdots`, `Ddots`, etc.). The third argument is the list of options. This command writes in the corresponding `\g_@@_type_lines_tl` the instruction which will actually draw the line after the construction of the matrix.

For example, for the following matrix,

```

\begin{pNiceMatrix}
1 & 2 & 3 & 4 \\
5 & \Cdots & & 6 \\
7 & \Cdots [color=red]
\end{pNiceMatrix}

```

$$\begin{pmatrix} 1 & 2 & 3 & 4 \\ 5 & \cdots & & 6 \\ 7 & \cdots & & \end{pmatrix}$$

the content of `\g_@@_Cdots_lines_tl` will be:

```

\@_draw_Cdots:nnn {2}{2}{}
\@_draw_Cdots:nnn {3}{2}{color=red}

```

The first argument is a boolean which indicates whether you must put the instruction on the left or on the right on the list of instructions (with consequences for the parallelisation of the diagonal lines).

```

1518     }
1519 }
```

If `booktabs` is loaded, we have to patch the macro `\@BTnormal` which is a macro of `booktabs`. The macro `\@BTnormal` draws an horizontal rule but it occurs after a vertical skip done by a low level TeX command. When this macro `\@BTnormal` occurs, the `row` node has yet been inserted by `nicematrix` before the vertical skip (and thus, at a wrong place). That why we decide to create a new `row` node (for the same row). We patch the macro `\@BTnormal` to create this `row` node. This new `row` node will

overwrite the previous definition of that `row` node and we have managed to avoid the error messages of that redefinition⁴.

```

1521 \hook_gput_code:nnn { begindocument } { . }
1522 {
1523   \IfPackageLoadedTF { booktabs }

1550   }
1551 }
```

The environment `{array}` uses internally the command `\ialign`. We change the definition of `\ialign` for several reasons. In particular, `\ialign` sets `\everycr` to `{ }` and we *need* to have to change the value of `\everycr`.

```

1552 \cs_set_nopar:Npn \ialign
1553 {
1554   \@@_redefine_everycr:
1555   \tabskip = \c_zero_skip
```

⁴cf. `\nicematrix@ redefine@check@rerun`

The box `\@carstrutbox` is a box constructed in the beginning of the environment `{array}`. The construction of that box takes into account the current value of `\arraystretch`⁵ and `\extrarowheight` (of `array`). That box is inserted (via `\@carstrut`) in the beginning of each row of the array. That's why we use the dimensions of that box to initialize the variables which will be the dimensions of the potential first and last row of the environment. This initialization must be done after the creation of `\@carstrutbox` and that's why we do it in the `\ialign`.

```

1556 \dim_gzero_new:N \g_@@_dp_row_zero_dim
1557 \dim_gset:Nn \g_@@_dp_row_zero_dim { \box_dp:N \@carstrutbox }

1616         }
1617     }

```

The sequence `\g_@@_multicolumn_cells_seq` will contain the list of the cells of the array where a command `\multicolumn{n}{...}{...}` with $n > 1$ is issued. In `\g_@@_multicolumn_sizes_seq`, the “sizes” (that is to say the values of n) correspondant will be stored. These lists will be used for the creation of the “medium nodes” (if they are created).

```

1618   \seq_gclear:N \g_@@_multicolumn_cells_seq
1619   \seq_gclear:N \g_@@_multicolumn_sizes_seq

```

The counter `\c@iRow` will be used to count the rows of the array (its incrementation will be in the first cell of the row).

```

1620   \int_gset:Nn \c@iRow { \l_@@_first_row_int - 1 }

```

At the end of the environment `{array}`, `\c@iRow` will be the total number de rows.

`\g_@@_row_total_int` will be the number of rows excepted the last row (if `\l_@@_last_row_bool` has been raised with the option `last-row`).

```

1621   \int_gzero_new:N \g_@@_row_total_int

```

The counter `\c@jCol` will be used to count the columns of the array. Since we want to know the total number of columns of the matrix, we also create a counter `\g_@@_col_total_int`. These counters are updated in the command `\@@_cell_begin:w` executed at the beginning of each cell.

```

1622   \int_gzero_new:N \g_@@_col_total_int
1623   \cs_set_eq:NN \c@ifnextchar \new@ifnextchar
1624   \bool_gset_false:N \g_@@_last_col_found_bool

```

During the construction of the array, the instructions `\Cdots`, `\Ldots`, etc. will be written in token lists `\g_@@_Cdots_lines_tl`, etc. which will be executed after the construction of the array.

```

1625   \tl_gclear_new:N \g_@@_Cdots_lines_tl
1626   \tl_gclear_new:N \g_@@_Ldots_lines_tl
1627   \tl_gclear_new:N \g_@@_Vdots_lines_tl
1628   \tl_gclear_new:N \g_@@_Ddots_lines_tl

1631
1632   \tl_gclear:N \g_nicematrix_code_before_tl
1633   \tl_gclear:N \g_@@_pre_code_before_tl
1634 }

```

This is the end of \@@_pre_array_ii::

The command \@@_pre_array: will be executed after analyse of the keys of the environment.

```

1634 \cs_new_protected:Npn \@@_pre_array:
1635 {
1636     \cs_if_exist:NT \theiRow { \int_set_eq:NN \l_@@_old_iRow_int \c@iRow }
1637     \int_gzero_new:N \c@iRow
1638     \cs_if_exist:NT \thejCol { \int_set_eq:NN \l_@@_old_jCol_int \c@jCol }
1639     \int_gzero_new:N \c@jCol

```

We recall that \l_@@_last_row_int and \l_@@_last_column_int are *not* the numbers of the last row and last column of the array. There are only the values of the keys `last-row` and `last-column` (maybe the user has provided erroneous values). The meaning of that counters does not change during the environment of `nicematrix`. There is only a slight adjustment: if the user have used one of those keys without value, we provide now the right value as read on the `aux` file (of course, it's possible only after the first compilation).

```

1640 \int_compare:nNnT \l_@@_last_row_int = { -1 }
1641 {
1642     \bool_set_true:N \l_@@_last_row_without_value_bool
1643     \bool_if:NT \g_@@_aux_found_bool
1644         { \int_set:Nn \l_@@_last_row_int { \seq_item:Nn \g_@@_size_seq 3 } }
1645 }
1646 \int_compare:nNnT \l_@@_last_col_int = { -1 }
1647 {
1648     \bool_if:NT \g_@@_aux_found_bool
1649         { \int_set:Nn \l_@@_last_col_int { \seq_item:Nn \g_@@_size_seq 6 } }
1650 }

```

If there is an exterior row, we patch a command used in \@@_cell_begin:w in order to keep track of some dimensions needed to the construction of “last row”.

```

1651 \int_compare:nNnT \l_@@_last_row_int > { -2 }
1652 {
1653     \tl_put_right:Nn \@@_update_for_first_and_last_row:

1657         \dim_gset:Nn \g_@@_dp_last_row_dim
1658             { \dim_max:nn \g_@@_dp_last_row_dim { \box_dp:N \l_@@_cell_box } }
1659     }
1660 }

1661 \seq_gclear:N \g_@@_cols_vlism_seq
1662 \seq_gclear:N \g_@@_submatrix_seq

```

Now the \CodeBefore.

```
1663 \bool_if:NT \l_@@_code_before_bool \@@_exec_code_before:
```

The value of \g_@@_pos_of_blocks_seq has been written on the `aux` file and loaded before the (potential) execution of the \CodeBefore. Now, we clear that variable because it will be reconstructed during the creation of the array.

```
1664 \seq_gclear:N \g_@@_pos_of_blocks_seq
```

Idem for other sequences written on the `aux` file.

```

1665 \seq_gclear_new:N \g_@@_multicolumn_cells_seq
1666 \seq_gclear_new:N \g_@@_multicolumn_sizes_seq

```

The command `\create_row_node:` will create a row-node (and not a row of nodes!). However, at the end of the array we construct a “false row” (for the col-nodes) and it interferes with the construction of the last row-node of the array. We don’t want to create such row-node twice (to avoid warnings or, maybe, errors). That’s why the command `\@_create_row_node:` will use the following counter to avoid such construction.

```
1667 \int_gset:Nn \g_@@_last_row_node_int { -2 }
```

The value -2 is important.

The code in `\@_pre_array_ii:` is used only here.

```
1668 \@_pre_array_ii:
```

The array will be composed in a box (named `\l_@@_the_array_box`) because we have to do manipulations concerning the potential exterior rows.

```
1669 \box_clear_new:N \l_@@_the_array_box
```

We compute the width of both delimiters. We remind that, when the environment `{NiceArray}` is used, it’s possible to specify the delimiters in the preamble (eg `[ccc]`).

```
1670 \dim_zero_new:N \l_@@_left_delim_dim
1671 \dim_zero_new:N \l_@@_right_delim_dim
1672 \bool_if:NTF \g_@@_delims_bool
1673 {
```

The command `\bBigg@` is a command of `amsmath`.

```
1674 \hbox_set:Nn \l_tmpa_box { $ \bBigg@ 5 \g_@@_left_delim_tl $ }
1675 \dim_set:Nn \l_@@_left_delim_dim { \box_wd:N \l_tmpa_box }
1676 \hbox_set:Nn \l_tmpa_box { $ \bBigg@ 5 \g_@@_right_delim_tl $ }
1677 \dim_set:Nn \l_@@_right_delim_dim { \box_wd:N \l_tmpa_box }
1678 }
1679 {
1680     \dim_gset:Nn \l_@@_left_delim_dim
1681         { 2 \bool_if:NTF \l_@@_tabular_bool \tabcolsep \arraycolsep }
1682     \dim_gset_eq:NN \l_@@_right_delim_dim \l_@@_left_delim_dim
1683 }
```

Here is the beginning of the box which will contain the array. The `\hbox_set_end:` corresponding to this `\hbox_set:Nw` will be in the second part of the environment (and the closing `\c_math_toggle_token` also).

```
1684 \hbox_set:Nw \l_@@_the_array_box
1685 \skip_horizontal:N \l_@@_left_margin_dim
1686 \skip_horizontal:N \l_@@_extra_left_margin_dim
1687 \c_math_toggle_token
1688 \bool_if:NTF \l_@@_light_syntax_bool
1689     { \use:c { @@-light-syntax } }
1690     { \use:c { @@-normal-syntax } }
1691 }
```

The following command `\@_CodeBefore_Body:w` will be used when the keyword `\CodeBefore` is present at the beginning of the environment.

```
1692 \cs_new_protected_nopar:Npn \@_CodeBefore_Body:w #1 \Body
1693 {
1694     \tl_set:Nn \l_tmpa_tl { #1 }
1695     \int_compare:nNnT { \char_value_catcode:n { 60 } } = { 13 }
1696         { \@_rescan_for_spanish:N \l_tmpa_tl }
1697     \tl_gput_left:NV \g_@@_pre_code_before_tl \l_tmpa_tl
1698     \bool_set_true:N \l_@@_code_before_bool
```

We go on with `\@_pre_array:` which will (among other) execute the `\CodeBefore` (specified in the key `code-before` or after the keyword `\CodeBefore`). By definition, the `\CodeBefore` must be executed before the body of the array...

```
1699 \@_pre_array:
1700 }
```

10 The \CodeBefore

The following command will be executed if the \CodeBefore has to be actually executed (that command will be used only once and is present only for legibility).

```
1701 \cs_new_protected:Npn \@@_pre_code_before:
1702 {
```

First, we give values to the LaTeX counters `iRow` and `jCol`. We remind that, in the \CodeBefore (and in the \CodeAfter) they represent the numbers of rows and columns of the array (without the potential last row and last column). The value of `\g_@@_row_total_int` is the number of the last row (with potentially a last exterior row) and `\g_@@_col_total_int` is the number of the last column (with potentially a last exterior column).

```
1703 \int_set:Nn \c@iRow { \seq_item:Nn \g_@@_size_seq 2 }
1704 \int_set:Nn \c@jCol { \seq_item:Nn \g_@@_size_seq 5 }
1705 \int_set_eq:NN \g_@@_row_total_int { \seq_item:Nn \g_@@_size_seq 3 }
1706 \int_set_eq:NN \g_@@_col_total_int { \seq_item:Nn \g_@@_size_seq 6 }
```

Now, we will create all the `col` nodes and `row` nodes with the informations written in the `aux` file. You use the technique described in the page 1229 of `pgfmanual.pdf`, version 3.1.4b.

```
1707 \pgfsys@markposition { \@@_env: - position }
1708 \pgfsys@getposition { \@@_env: - position } \@@_picture_position:
1709 \pgfpicture
1710 \pgf@relevantforpicturesizefalse
```

First, the recreation of the `row` nodes.

```
1711 \int_step_inline:nnn \l_@@_first_row_int { \g_@@_row_total_int + 1 }
1712 {
1713     \pgfsys@getposition { \@@_env: - row - ##1 } \@@_node_position:
1714     \pgfcoordinate { \@@_env: - row - ##1 }
1715         { \pgfpointdiff \@@_picture_position: \@@_node_position: }
1716 }
```

Now, the recreation of the `col` nodes.

```
1717 \int_step_inline:nnn \l_@@_first_col_int { \g_@@_col_total_int + 1 }
1718 {
1719     \pgfsys@getposition { \@@_env: - col - ##1 } \@@_node_position:

1748 }

1749 \cs_new_protected:Npn \@@_exec_code_before:
1750 {
1751     \seq_gclear_new:N \g_@@_colors_seq

```

The sequence `\g_@@_colors_seq` will always contain as first element the special color `nocolor`: when that color is used, no color will be applied in the corresponding cells by the other coloring commands of `nicematrix`.

```

1752     \@@_add_to_colors_seq:nn { { nocolor } } { }
1753     \bool_gset_false:N \g_@@_recreate_cell_nodes_bool
1754     \group_begin:

```

We compose the `\CodeBefore` in math mode in order to nullify the spaces put by the user between instructions in the `\CodeBefore`.

```
1755     \bool_if:NT \l_@@_tabular_bool \c_math_toggle_token
```

The following code is a security for the case the user has used `babel` with the option `spanish`: in that case, the characters < (de code ASCII 60) and > are activated and `Tikz` is not able to solve the problem (even with the `Tikz` library `babel`).

```

1756     \int_compare:nNnT { \char_value_catcode:n { 60 } } = { 13 }
1757     { \@@_rescan_for_spanish:N \l_@@_code_before_tl }

```

Here is the `\CodeBefore`. The construction is a bit complicated because `\g_@@_pre_code_before_tl` may begin with keys between square brackets. Moreover, after the analyze of those keys, we sometimes have to decide to do *not* execute the rest of `\g_@@_pre_code_before_tl` (when it is asked for the creation of cell nodes in the `\CodeBefore`). That's why we use a `\q_stop`: it will be used to discard the rest of `\g_@@_pre_code_before_tl`.

```

1758     \exp_last_unbraced:NV \@@_CodeBefore_keys:
1759     \g_@@_pre_code_before_tl

```

Now, all the cells which are specified to be colored by instructions in the `\CodeBefore` will actually be colored. It's a two-stages mechanism because we want to draw all the cells with the same color at the same time to absolutely avoid thin white lines in some PDF viewers.

```

1760     \@@_actually_color:
1761     \l_@@_code_before_tl

```

The command `\CT@arc@` contains the instruction of color for the rules of the array⁷. This command is used by `\CT@arc@` but we use it also for compatibility with `colortbl`. But we want also to be able to use color for the rules of the array when `colortbl` is *not* loaded. That's why we do the following instruction which is in the patch of the beginning of arrays done by `colortbl`. Of course, we restore the value of `\CT@arc@` at the end of our environment.

```
1896 \cs_gset_eq:NN \@@_old_CT@arc@ \CT@arc@
```

We deactivate Tikz externalization because we will use PGF pictures with the options `overlay` and `remember picture` (or equivalent forms). We deactivate with `\tikzexternalisable` and not with `\tikzset{external/export=false}` which is *not* equivalent.

```

1897 \cs_if_exist:NT \tikz@library@external@loaded
1898 {
1899   \tikzexternalisable
2000   \cs_if_exist:NT \ifstandalone
2001     { \tikzset { external / optimize = false } }
2002 }
```

We increment the counter `\g_@@_env_int` which counts the environments of the package.

```

1903 \int_gincr:N \g_@@_env_int
1904 \bool_if:NF \l_@@_block_auto_columns_width_bool
1905   { \dim_gzero_new:N \g_@@_max_cell_width_dim }
```

The sequence `\g_@@_blocks_seq` will contain the carateristics of the blocks (specified by `\Block`) of the array. The sequence `\g_@@_pos_of_blocks_seq` will contain only the position of the blocks (except the blocks with the key `hvlines`).

```

1906 \seq_gclear:N \g_@@_blocks_seq
1907 \seq_gclear:N \g_@@_pos_of_blocks_seq
```

In fact, the sequence `\g_@@_pos_of_blocks_seq` will also contain the positions of the cells with a `\diagbox` and the `\multicolumn`.

```

1908 \seq_gclear:N \g_@@_pos_of_stroken_blocks_seq
1909 \seq_gclear:N \g_@@_pos_of_xdots_seq
1910 \tl_gclear_new:N \g_@@_code_before_tl
1911 \tl_gclear:N \g_@@_row_style_tl
```

We load all the informations written in the `aux` file during previous compilations corresponding to the current environment.

⁷e.g. `\color[rgb]{0.5,0.5,0}`

```

1912 \tl_if_exist:cTF { c_@@_int_use:N \g_@@_env_int _ tl }
1913 {
1914     \bool_gset_true:N \g_@@_aux_found_bool
1915     \use:c { c_@@_int_use:N \g_@@_env_int _ tl }
1916 }
1917 { \bool_gset_false:N \g_@@_aux_found_bool }

```

Now, we prepare the token list for the instructions that we will have to write on the `aux` file at the end of the environment.

```

1918 \tl_gclear:N \g_@@_aux_tl
1919 \tl_if_empty:NF \g_@@_code_before_tl
1920 {
1921     \bool_set_true:N \l_@@_code_before_bool
1922     \tl_put_right:NV \l_@@_code_before_tl \g_@@_code_before_tl
1923 }
1924 \tl_if_empty:NF \g_@@_pre_code_before_tl
1925 { \bool_set_true:N \l_@@_code_before_bool }

```

The set of keys is not exactly the same for `{NiceArray}` and for the variants of `{NiceArray}` (`{pNiceArray}`, `{bNiceArray}`, etc.) because, for `{NiceArray}`, we have the options `t`, `c`, `b` and `baseline`.

```

1926 \bool_if:NTF \g_@@_delims_bool
1927 { \keys_set:nn { NiceMatrix / pNiceArray } }
1928 { \keys_set:nn { NiceMatrix / NiceArray } }
1929 { #3 , #5 }

1930 \@@_set_Carc@:o \l_@@_rules_color_tl

```

The argument `#6` is the last argument of `{NiceArrayWithDelims}`. With that argument of type “`t \CodeBefore`”, we test whether there is the keyword `\CodeBefore` at the beginning of the body of the environment. If that keyword is present, we have now to extract all the content between that keyword `\CodeBefore` and the (other) keyword `\Body`. It’s the job that will do the command `\@@_CodeBefore_Body:w`. After that job, the command `\@@_CodeBefore_Body:w` will go on with `\@@_pre_array:`.

```

1931 \IfBooleanTF { #6 } \@@_CodeBefore_Body:w \@@_pre_array:
1932 }

```

Now, the second part of the environment `{NiceArrayWithDelims}`.

```

1933 {
1934     \bool_if:NTF \l_@@_light_syntax_bool
1935     { \use:c { end @@-light-syntax } }
1936     { \use:c { end @@-normal-syntax } }
1937     \c_math_toggle_token
1938     \skip_horizontal:N \l_@@_right_margin_dim
1939     \skip_horizontal:N \l_@@_extra_right_margin_dim
1940     \hbox_set_end:

```

End of the construction of the array (in the box `\l_@@_the_array_box`).

If the user has used the key `width` without any column `X`, we raise an error.

```

1941 \bool_if:NT \l_@@_width_used_bool
1942 {
1943     \int_if_zero:nT \g_@@_total_X_weight_int
1944     { \@@_error_or_warning:n { width-without-X-columns } }
1945 }

```

Now, if there is at least one `X`-column in the environment, we compute the width that those columns will have (in the next compilation). In fact, `\l_@@_X_columns_dim` will be the width of a column of weight 1. For a `X`-column of weight `n`, the width will be `\l_@@_X_columns_dim` multiplied by `n`.

```

1946 \int_compare:nNnT \g_@@_total_X_weight_int > \c_zero_int
1947 {
1948     \tl_gput_right:Nx \g_@@_aux_tl
1949     {

```

```

1950     \bool_set_true:N \l_@@_X_columns_aux_bool
1951     \dim_set:Nn \l_@@_X_columns_dim
1952     {
1953         \dim_compare:nNnTF
1954         {
1955             \dim_abs:n
1956             { \l_@@_width_dim - \box_wd:N \l_@@_the_array_box }
1957         }
1958         <
1959         { 0.001 pt }
1960         { \dim_use:N \l_@@_X_columns_dim }
1961         {
1962             \dim_eval:n
1963             {
1964                 ( \l_@@_width_dim - \box_wd:N \l_@@_the_array_box )
1965                 / \int_use:N \g_@@_total_X_weight_int
1966                 + \l_@@_X_columns_dim
1967             }
1968         }
1969     }
1970 }
1971

```

If the user has used the key `last-row` with a value, we control that the given value is correct (since we have just constructed the array, we know the actual number of rows of the array).

```

1972     \int_compare:nNnT \l_@@_last_row_int > { -2 }
1973     {
1974         \bool_if:NF \l_@@_last_row_without_value_bool
1975         {
1976             \int_compare:nNnF \l_@@_last_row_int = \c@iRow
1977             {
1978                 \@@_error:n { Wrong-last-row }
1979                 \int_gset_eq:NN \l_@@_last_row_int \c@iRow
1980             }
1981         }
1982     }

```

Now, the definition of `\c@jCol` and `\g_@@_col_total_int` change: `\c@jCol` will be the number of columns without the “last column”; `\g_@@_col_total_int` will be the number of columns with this “last column”.⁸

```

1983     \int_gset_eq:NN \c@jCol \g_@@_col_total_int
1984     \bool_if:NTF \g_@@_last_col_found_bool
1985     { \int_gdecr:N \c@jCol }
1986     {
1987         \int_compare:nNnT \l_@@_last_col_int > { -1 }
1988         { \@@_error:n { last-col-not-used } }
1989     }

```

We fix also the value of `\c@iRow` and `\g_@@_row_total_int` with the same principle.

```

1990     \int_gset_eq:NN \g_@@_row_total_int \c@iRow
1991     \int_compare:nNnT \l_@@_last_row_int > { -1 } { \int_gdecr:N \c@iRow }

```

Now, we begin the real construction in the output flow of TeX. First, we take into account a potential “first column” (we remind that this “first column” has been constructed in an overlapping position and that we have computed its width in `\g_@@_width_first_col_dim`: see p. 88).

```

1992     \int_if_zero:nT \l_@@_first_col_int
1993     { \skip_horizontal:N \g_@@_width_first_col_dim }

```

The construction of the real box is different whether we have delimiters to put.

```

1994     \bool_if:nTF { ! \g_@@_delims_bool }
1995     {

```

⁸We remind that the potential “first column” (exterior) has the number 0.

```

1996 \tl_if_eq:NNTF \l_@@_baseline_tl \c_@@_c_tl
1997   \@@_use_arraybox_with_notes_c:
1998   {
1999     \tl_if_eq:NNTF \l_@@_baseline_tl \c_@@_b_tl
2000       \@@_use_arraybox_with_notes_b:
2001         \@@_use_arraybox_with_notes:
2002   }
2003 }
```

Now, in the case of an environment with delimiters. We compute \l_tma_dim which is the total height of the “first row” above the array (when the key `first-row` is used).

```

2004 {
2005   \int_if_zero:nTF \l_@@_first_row_int
2006   {
2007     \dim_set_eq:NN \l_tma_dim \g_@@_dp_row_zero_dim
2008     \dim_add:Nn \l_tma_dim \g_@@_ht_row_zero_dim
2009   }
2010   { \dim_zero:N \l_tma_dim }
```

We compute \l_tpb_dim which is the total height of the “last row” below the array (when the key `last-row` is used). A value of -2 for $\l_@@_last_row_int$ means that there is no “last row”.⁹

```

2011 \int_compare:nNnTF \l_@@_last_row_int > { -2 }
2012 {
2013   \dim_set_eq:NN \l_tpb_dim \g_@@_ht_last_row_dim
2014   \dim_add:Nn \l_tpb_dim \g_@@_dp_last_row_dim
2015 }
2016 { \dim_zero:N \l_tpb_dim }

2017 \hbox_set:Nn \l_tma_box
2018 {
2019   \c_math_toggle_token
2020   \@@_color:o \l_@@_delimiters_color_tl
2021   \exp_after:wN \left \g_@@_left_delim_tl
2022   \vcenter
2023 }
```

We take into account the “first row” (we have previously computed its total height in \l_tma_dim). The `\hbox:n` (or `\hbox`) is necessary here.

```

2024   \skip_vertical:n { -\l_tma_dim - \arrayrulewidth }
2025   \hbox
2026   {
2027     \bool_if:NTF \l_@@_tabular_bool
2028       { \skip_horizontal:N -\tabcolsep }
2029       { \skip_horizontal:N -\arraycolsep }
2030     \@@_use_arraybox_with_notes_c:
2031     \bool_if:NTF \l_@@_tabular_bool
2032       { \skip_horizontal:N -\tabcolsep }
2033       { \skip_horizontal:N -\arraycolsep }
2034 }
```

We take into account the “last row” (we have previously computed its total height in \l_tpb_dim).

```

2035   \skip_vertical:N -\l_tpb_dim
2036   \skip_vertical:N \arrayrulewidth
2037   }
2038   \exp_after:wN \right \g_@@_right_delim_tl
2039   \c_math_toggle_token
2040 }
```

Now, the box \l_tma_box is created with the correct delimiters.

We will put the box in the TeX flow. However, we have a small work to do when the option `delimiters/max-width` is used.

```

2041   \bool_if:NTF \l_@@_delimiters_max_width_bool
2042   {
```

⁹A value of -1 for $\l_@@_last_row_int$ means that there is a “last row” but the user have not set the value with the option `last row` (and we are in the first compilation).

```

2043     \@@_put_box_in_flow_bis:nn
2044         \g_@@_left_delim_tl
2045         \g_@@_right_delim_tl
2046     }
2047     \@@_put_box_in_flow:
2048 }
```

We take into account a potential “last column” (this “last column” has been constructed in an overlapping position and we have computed its width in `\g_@@_width_last_col_dim`: see p. 89).

```

2049 \bool_if:NT \g_@@_last_col_found_bool
2050   { \skip_horizontal:N \g_@@_width_last_col_dim }
2051 \bool_if:NT \l_@@_preamble_bool
2052   {

2064   }
2065 \iow_now:Nn \mainaux { \ExplSyntaxOff }

2066 \bool_if:NT \g_@@_footnote_bool \endsavenotes
2067 }
```

This is the end of the environment `{NiceArrayWithDelims}`.

12 We construct the preamble of the array

The final user provides a preamble, but we must convert that preamble into a preamble that will be given to `\array` (of the package `array`).

The preamble given by the final user is stored in `\g_@@_user_preamble_tl`. The modified version will be stored in `\g_@@_array_preamble_tl` also.

```

2068 \cs_new_protected:Npn \@@_transform_preamble:
2069   {
2070     \@@_transform_preamble_i:
2071     \@@_transform_preamble_ii:
2072   }

2073 \cs_new_protected:Npn \@@_transform_preamble_i:
2074   {
2075     \int_gzero:N \c@jCol
```

The sequence `\g_@@_cols_vlsim_seq` will contain the numbers of the columns where you will have to draw vertical lines in the potential sub-matrices (hence the name `vlsim`).

```
2076 \seq_gclear:N \g_@@_cols_vlism_seq
```

`\g_tmpb_bool` will be raised if you have a `|` at the end of the preamble provided by the final user.

```
2077 \bool_gset_false:N \g_tmpb_bool
```

The following sequence will store the arguments of the successive `>` in the preamble.

```

2078     \tl_gclear_new:N \g_@@_pre_cell_tl
2079
2080 The counter \l_tmpa_int will count the number of consecutive occurrences of the symbol |.
2081     \int_zero:N \l_tmpa_int
2082     \tl_gclear:N \g_@@_array_preamble_tl
2083     \tl_if_eq:NNTF \l_@@_vlines_clist \c_@@_all_tl
2084     {
2085         \tl_gset:Nn \g_@@_array_preamble_tl
2086         { ! { \skip_horizontal:N \arrayrulewidth } }
2087     }
2088     {
2089         \clist_if_in:NnT \l_@@_vlines_clist 1
2090         {

```

#1 is the optional argument of `{minipage}` (or `{varwidth}`): t or b. Indeed, for the columns of type m, we use the value b here because there is a special post-action in order to center vertically the box (see #4).

#2 is the width of the `{minipage}` (or `{varwidth}`), that is to say also the width of the column.

#3 is the coding for the horizontal position of the content of the cell (`\centering`, `\raggedright`, `\raggedleft` or nothing). It's also possible to put in that #3 some code to fix the value of `\l_@@_hpos_cell_t1` which will be available in each cell of the column.

#4 is an extra-code which contains `\@@_center_cell_box`: (when the column is a m column) or nothing (in the other cases).

#5 is a code put just before the c (or r or l: see #8).

#6 is a code put just after the c (or r or l: see #8).

#7 is the type of environment: `minipage` or `varwidth`.

#8 is the letter c or r or l which is the basic specifcier of column which is used *in fine*.

```

Now, we can put the box in the TeX flow with the horizontal adjustments on both sides.

```
3191 \skip_horizontal:N \l_@@_left_delim_dim
3192 \skip_horizontal:N -\l_@@_real_left_delim_dim
3193 \@@_put_box_in_flow:
3194 \skip_horizontal:N \l_@@_right_delim_dim
3195 \skip_horizontal:N -\l_@@_real_right_delim_dim
3196 }
```

The construction of the array in the environment `{NiceArrayWithDelims}` is, in fact, done by the environment `{@-light-syntax}` or by the environment `{@-normal-syntax}` (whether the option `light-syntax` is in force or not). When the key `light-syntax` is not used, the construction is a standard environment (and, thus, it's possible to use verbatim in the array).

```
3197 \NewDocumentEnvironment { @-normal-syntax } { }
```

First, we test whether the environment is empty. If it is empty, we raise a fatal error (it's only a security). In order to detect whether it is empty, we test whether the next token is `\end` and, if it's the case, we test if this is the end of the environment (if it is not, an standard error will be raised by LaTeX for incorrect nested environments).

```
3198 {
3199   \peek_remove_spaces:n
3200   {
3201     \peek_meaning:NTF \end
3202     \@@_analyze_end:Nn
3203     {
3204       \@@_transform_preamble:
```

Here is the call to `\array` (we have a dedicated macro `\@@_array`: because of compatibility with the classes `revtex4-1` and `revtex4-2`).

```

3205     \exp_args:No \@@_array: \g_@@_array_preamble_t1
3206     }
3207   }
3208 }
3209 {
3210   \@@_create_col_nodes:
3211   \endarray
3212 }
```

When the key `light-syntax` is in force, we use an environment which takes its whole body as an argument (with the specifier `b`).

```

3213 \NewDocumentEnvironment { @@-light-syntax } { b }
3214 {
```

First, we test whether the environment is empty. It's only a security. Of course, this test is more easy than the similar test for the "normal syntax" because we have the whole body of the environment in #1.

```

3215 \tl_if_empty:nT { #1 } { \@@_fatal:n { empty~environment } }
3216 \tl_map_inline:nn { #1 }
3217 {
3218   \str_if_eq:nnT { ##1 } { & }
3219   { \@@_fatal:n { ampersand-in-light-syntax } }
3220   \str_if_eq:nnT { ##1 } { \\ }
3221   { \@@_fatal:n { double-backslash-in-light-syntax } }
3222 }
```

Now, you extract the `\CodeAfter` of the body of the environment. Maybe, there is no command `\CodeAfter` in the body. That's why you put a marker `\CodeAfter` after #1. If there is yet a `\CodeAfter` in #1, this second (or third...) `\CodeAfter` will be catched in the value of `\g_nicematrix_code_after_t1`. That doesn't matter because `\CodeAfter` will be set to `no-op` before the execution of `\g_nicematrix_code_after_t1`.

```
3223 \@@_light_syntax_i:w #1 \CodeAfter \q_stop
```

The command `\array` is hidden somewhere in `\@@_light_syntax_i:w`.

```
3224 }
```

Now, the second part of the environment. We must leave these lines in the second part (and not put them in the first part even though we caught the whole body of the environment with an argument of type `b`) in order to have the columns `S` of `siunitx` working fine.

```

3225 {
3226   \@@_create_col_nodes:
3227   \endarray
3228 }

3229 \cs_new_protected:Npn \@@_light_syntax_i:w #1\CodeAfter #2\q_stop
3230 {
3231   \tl_gput_right:Nn \g_nicematrix_code_after_t1 { #2 }
```

The body of the array, which is stored in the argument #1, is now splitted into items (and *not* tokens).

```
3232 \seq_clear_new:N \l_@@_rows_seq
```

We rescan the character of end of line in order to have the correct catcode.

```

3233 \tl_set_rescan:Nno \l_@@_end_of_row_t1 { } \l_@@_end_of_row_t1
3234 \bool_if:NTF \l_@@_light_syntax_expanded_bool
3235   \seq_set_split:Nee
3236   \seq_set_split:NVn
3237   \l_@@_rows_seq \l_@@_end_of_row_t1 { #1 }
```

We delete the last row if it is empty.

```

3238 \seq_pop_right:NN \l_@@_rows_seq \l_tmpa_t1
3239 \tl_if_empty:NF \l_tmpa_t1
3240   { \seq_put_right:No \l_@@_rows_seq \l_tmpa_t1 }
```

If the environment uses the option `last-row` without value (i.e. without saying the number of the rows), we have now the opportunity to compute that value. We do it, and so, if the token list `\l_@@_code_for_last_row_t1` is not empty, we will use directly where it should be.

```
3241     \int_compare:nNnT \l_@@_last_row_int = { -1 }
3242         { \int_set:Nn \l_@@_last_row_int { \seq_count:N \l_@@_rows_seq } }
```

The new value of the body (that is to say after replacement of the separators of rows and columns by `\backslash` and `&`) of the environment will be stored in `\l_@@_new_body_t1` in order to allow the use of commands such as `\hline` or `\hdottedline` with the key `light-syntax`.

```
3243     \tl_build_begin:N \l_@@_new_body_t1
3244     \int_zero_new:N \l_@@_nb_cols_int
```

First, we treat the first row.

```
3245     \seq_pop_left:NN \l_@@_rows_seq \l_tmpa_t1
3246     \@@_line_with_light_syntax:o \l_tmpa_t1
```

Now, the other rows (with the same treatment, excepted that we have to insert `\backslash` between the rows).

```
3247     \seq_map_inline:Nn \l_@@_rows_seq
3248     {
3249         \tl_build_put_right:Nn \l_@@_new_body_t1 { \backslash }
3250         \@@_line_with_light_syntax:n { ##1 }
3251     }
3252     \tl_build_end:N \l_@@_new_body_t1
3253     \int_compare:nNnT \l_@@_last_col_int = { -1 }
3254     {
3255         \int_set:Nn \l_@@_last_col_int
3256         { \l_@@_nb_cols_int - 1 + \l_@@_first_col_int }
3257     }
```

Now, we can construct the preamble: if the user has used the key `last-col`, we have the correct number of columns even though the user has used `last-col` without value.

```
3258     \@@_transform_preamble:
```

The call to `\array` is in the following command (we have a dedicated macro `\@@_array`: because of compatibility with the classes `revtex4-1` and `revtex4-2`).

```

When the option `last-col` is used in the environments with explicit preambles (like `{NiceArray}`, `{pNiceArray}`, etc.) a special type of column is used at the end of the preamble in order to compose the cells in an overlapping position (with `\hbox_overlap_right:n`) but (if `last-col` has been used), we don't have the number of that last column. However, we have to know that number for the color of the potential `\Vdots` drawn in that last column. That's why we fix the correct value of `\l_@@_last_col_int` in that case.

```

3750   \bool_if:NT \g_@@_last_col_found_bool
3751     { \int_set_eq:NN \l_@@_last_col_int \g_@@_col_total_int }

```

If we are in an environment without preamble (like `{NiceMatrix}` or `{pNiceMatrix}`) and if the option `last-col` has been used without value we also fix the real value of `\l_@@_last_col_int`.

```

3752   \bool_if:NT \l_@@_last_col_without_value_bool
3753     { \int_set_eq:NN \l_@@_last_col_int \g_@@_col_total_int }

```

It's also time to give to `\l_@@_last_row_int` its real value.

```

3754   \bool_if:NT \l_@@_last_row_without_value_bool
3755     { \int_set_eq:NN \l_@@_last_row_int \g_@@_row_total_int }

\@@_restore_iRow_jCol:
```

The command `\CT@arc@` contains the instruction of color for the rules of the array¹². This command is used by `\CT@arc@` but we use it also for compatibility with `colortbl`. But we want also to be able to use color for the rules of the array when `colortbl` is *not* loaded. That's why we do the following instruction which is in the patch of the end of arrays done by `colortbl`.

```
3898     \cs_gset_eq:NN \CT@arc@ \@@_old_CT@arc@
3899 }
```

The following command will extract the potential options (between square brackets) at the beginning of the `\CodeAfter` (that is to say, when `\CodeAfter` is used, the options of that “command” `\CodeAfter`). Idem for the `\CodeBefore`.

```
3900 \NewDocumentCommand \@@_CodeAfter_keys: { O { } }
3901   { \keys_set:nn { NiceMatrix / CodeAfter } { #1 } }
```

We remind that the first mandatory argument of the command `\Block` is the size of the block with the special format $i-j$. However, the user is allowed to omit i or j (or both). This will be interpreted as: the last row (resp. column) of the block will be the last row (resp. column) of the block (without the potential exterior row—resp. column—of the array). By convention, this is stored in

¹²e.g. `\color[rgb]{0.5,0.5,0}`

`\g_@@_pos_of_blocks_seq` (and `\g_@@_blocks_seq`) as a number of rows (resp. columns) for the block equal to 100. It's possible, after the construction of the array, to replace these values by the correct ones (since we know the number of rows and columns of the array).

```
3902 \cs_new_protected:Npn \@@_adjust_pos_of_blocks_seq:

3992       { \@@_env: - \int_use:N \l_tmpa_int }
3993     \pgfnodealias
3994       { \l_@@_name_str - last }
3995       { \@@_env: - last }
3996   }
3997 \endpgfpicture
3998 }

```

17 We draw the dotted lines

A dotted line will be said *open* in one of its extremities when it stops on the edge of the matrix and *closed* otherwise. In the following matrix, the dotted line is closed on its left extremity and open on its right.

$$\begin{pmatrix} a+b+c & a+b & a \\ a & \dots & \dots \\ a & a+b & a+b+c \end{pmatrix}$$

The command `\@_find_extremities_of_line:nnnn` takes four arguments:

- the first argument is the row of the cell where the command was issued;
- the second argument is the column of the cell where the command was issued;
- the third argument is the x -value of the orientation vector of the line;
- the fourth argument is the y -value of the orientation vector of the line.

This command computes:

- `\l_initial_i_int` and `\l_initial_j_int` which are the coordinates of one extremity of the line;
- `\l_final_i_int` and `\l_final_j_int` which are the coordinates of the other extremity of the line;
- `\l_initial_open_bool` and `\l_final_open_bool` to indicate whether the extremities are open or not.

```

4000 {
```

First, we declare the current cell as “dotted” because we forbide intersections of dotted lines.

```
4001 \cs_set:cpn { @_dotted_ #1 - #2 } { }
```

Initialization of variables.

```
4002 \int_set:Nn \l_initial_i_int { #1 }
4003 \int_set:Nn \l_initial_j_int { #2 }
4004 \int_set:Nn \l_final_i_int { #1 }
4005 \int_set:Nn \l_final_j_int { #2 }
```

We will do two loops: one when determinating the initial cell and the other when determinating the final cell. The boolean `\l_stop_loop_bool` will be used to control these loops. In the first loop, we search the “final” extremity of the line.

```
4006 \bool_set_false:N \l_stop_loop_bool
4007 \bool_do_until:Nn \l_stop_loop_bool
4008 {
4009     \int_add:Nn \l_final_i_int { #3 }
4010     \int_add:Nn \l_final_j_int { #4 }
```

We test if we are still in the matrix.

```
4011 \bool_set_false:N \l_final_open_bool
4012 \int_compare:nNnTF \l_final_i_int > \l_row_max_int

```

If the case is empty, we declare that the cell as non-empty. Indeed, we will draw a dotted line and the cell will be on that dotted line. All the cells of a dotted line have to be marked as "dotted" because we don't want intersections between dotted lines. We recall that the research of the extremities of the lines are all done in the same TeX group (the group of the environment), even though, when the extremities are found, each line is drawn in a TeX group that we will open for the options of the line.

```

- `\l_@@_final_i_int`
- `\l_@@_final_j_int`
- `\l_@@_final_open_bool.`

The following function is also used by `\Hdotsfor`.

```

4286 \cs_new_protected:Npn \@@_actually_draw_Ldots:
4287 {
4288     \bool_if:NTF \l_@@_initial_open_bool
4289     {
4290         \@@_open_x_initial_dim:
4291         \@@_qpoint:n { row - \int_use:N \l_@@_initial_i_int - base }
4292         \dim_set_eq:NN \l_@@_y_initial_dim \pgf@y
4293     }
4294     { \@@_set_initial_coords_from_anchor:n { base-east } }
4295     \bool_if:NTF \l_@@_final_open_bool
4296     {
4297         \@@_open_x_final_dim:
4298         \@@_qpoint:n { row - \int_use:N \l_@@_final_i_int - base }
4299         \dim_set_eq:NN \l_@@_y_final_dim \pgf@y
4300     }
4301     { \@@_set_final_coords_from_anchor:n { base-west } }

```

Now the case of a `\Hdotsfor` (or when there is only a `\Ldots`) in the “last row” (that case will probably arise when the final user draws an arrow to indicate the number of columns of the matrix). In the “first row”, we don’t need any adjustment.

```

4302 \bool_lazy_all:nTF
4303 {
4304     \l_@@_initial_open_bool
4305     \l_@@_final_open_bool
4306     { \int_compare_p:nNn \l_@@_initial_i_int = \l_@@_last_row_int }
4307 }
4308 {
4309     \dim_add:Nn \l_@@_y_initial_dim \c_@@_shift_Ldots_last_row_dim
4310     \dim_add:Nn \l_@@_y_final_dim \c_@@_shift_Ldots_last_row_dim
4311 }

```

We raise the line of a quantity equal to the radius of the dots because we want the dots really “on” the line of texte. Of course, maybe we should not do that when the option `line-style` is used (?).

```

4312 {
4313     \dim_add:Nn \l_@@_y_initial_dim \l_@@_xdots_radius_dim
4314     \dim_add:Nn \l_@@_y_final_dim \l_@@_xdots_radius_dim
4315 }
4316 \@@_draw_line:
4317 }

```

The first and the second arguments are the coordinates of the cell where the command has been issued. The third argument is the list of the options.

```

4318 \cs_new_protected:Npn \@@_draw_Cdots:nnn #1 #2 #3
4319 {

4431     \@@_actually_draw_Vdots:
4432     \group_end:
4433   }
4434 }
```

The command `\@@_actually_draw_Vdots:` has the following implicit arguments:

- `\l_@@_initial_i_int`
- `\l_@@_initial_j_int`
- `\l_@@_initial_open_bool`
- `\l_@@_final_i_int`
- `\l_@@_final_j_int`
- `\l_@@_final_open_bool.`

The following function is also used by `\Vdotsfor`.

```

4435 \cs_new_protected:Npn \@@_actually_draw_Vdots:
4436 {
```

First, the case of a dotted line open on both sides.

```
4437 \bool_lazy_and:nnTF \l_@@_initial_open_bool \l_@@_final_open_bool
```

We have to determine the x -value of the vertical rule that we will have to draw.

```

4438 {
4439   \@@_open_y_initial_dim:
4440   \@@_open_y_final_dim:
4441   \int_if_zero:nTF \l_@@_initial_j_int
```

We have a dotted line open on both sides in the “first column”.

```

4442 {
4443   \@@_qpoint:n { col - 1 }
4444   \dim_set_eq:NN \l_@@_x_initial_dim \pgf@x
4445   \dim_sub:Nn \l_@@_x_initial_dim \l_@@_left_margin_dim
4446   \dim_sub:Nn \l_@@_x_initial_dim \l_@@_extra_left_margin_dim
4447   \dim_sub:Nn \l_@@_x_initial_dim \c_@@_shift_exterior_Vdots_dim
4448 }
4449 {
450   \bool_lazy_and:nnTF
451   { \int_compare_p:nNn \l_@@_last_col_int > { -2 } }
452   { \int_compare_p:nNn \l_@@_initial_j_int = \g_@@_col_total_int }
```

We have a dotted line open on both sides in the “last column”.

```

4453 {
4454   \@@_qpoint:n { col - \int_use:N \l_@@_initial_j_int }
4455   \dim_set_eq:NN \l_@@_x_initial_dim \pgf@x
4456   \dim_add:Nn \l_@@_x_initial_dim \l_@@_right_margin_dim
4457   \dim_add:Nn \l_@@_x_initial_dim \l_@@_extra_right_margin_dim
4458   \dim_add:Nn \l_@@_x_initial_dim \c_@@_shift_exterior_Vdots_dim
4459 }
```

We have a dotted line open on both sides which is *not* in an exterior column.

```

4460 {
4461   \@@_qpoint:n { col - \int_use:N \l_@@_initial_j_int }
4462   \dim_set_eq:NN \l_tmpa_dim \pgf@x
4463   \@@_qpoint:n { col - \int_eval:n { \l_@@_initial_j_int + 1 } }
4464   \dim_set:Nn \l_@@_x_initial_dim { ( \pgf@x + \l_tmpa_dim ) / 2 }
4465 }
4466 }
4467 }
```

Now, the dotted line is *not* open on both sides (maybe open on only one side).
The boolean `\l_tmpa_bool` will indicate whether the column is of type l or may be considered as if.

```

4468   {
4469     \bool_set_false:N \l_tmpa_bool
4470     \bool_if:NF \l_@@_initial_open_bool
4471     {
4472       \bool_if:NF \l_@@_final_open_bool
4473       {
4474         \@@_set_initial_coords_from_anchor:n { south-west }
4475         \@@_set_final_coords_from_anchor:n { north-west }
4476         \bool_set:Nn \l_tmpa_bool
4477         { \dim_compare_p:nNn \l_@@_x_initial_dim = \l_@@_x_final_dim }
4478       }
4479     }

```

Now, we try to determine whether the column is of type c or may be considered as if.

```

4480   \bool_if:NTF \l_@@_initial_open_bool
4481   {
4482     \@@_open_y_initial_dim:
4483     \@@_set_final_coords_from_anchor:n { north }
4484     \dim_set_eq:NN \l_@@_x_initial_dim \l_@@_x_final_dim
4485   }
4486   {
4487     \@@_set_initial_coords_from_anchor:n { south }
4488     \bool_if:NTF \l_@@_final_open_bool
4489     \@@_open_y_final_dim:

```

Now the case where both extremities are closed. The first conditional tests whether the column is of type c or may be considered as if.

```

4490   {
4491     \@@_set_final_coords_from_anchor:n { north }
4492     \dim_compare:nNnF \l_@@_x_initial_dim = \l_@@_x_final_dim
4493     {
4494       \dim_set:Nn \l_@@_x_initial_dim
4495       {
4496         \bool_if:NTF \l_tmpa_bool \dim_min:nn \dim_max:nn
4497           \l_@@_x_initial_dim \l_@@_x_final_dim
4498       }
4499     }
4500   }
4501 }
4502 }
4503 \dim_set_eq:NN \l_@@_x_final_dim \l_@@_x_initial_dim
4504 \@@_draw_line:
4505 }

```

For the diagonal lines, the situation is a bit more complicated because, by default, we parallelize the diagonals lines. The first diagonal line is drawn and then, all the other diagonal lines are drawn parallel to the first one.

The first and the second arguments are the coordinates of the cell where the command has been issued. The third argument is the list of the options.

```

4506 \cs_new_protected:Npn \@@_draw_Ddots:nnn #1 #2 #3
4507   {
4508     \@@_adjust_to_submatrix:nn { #1 } { #2 }
4509     \cs_if_free:cT { @_ _ dotted _ #1 - #2 }
4510     {
4511       \@@_find_extremities_of_line:nnnn { #1 } { #2 } 1 1

```

The previous command may have changed the current environment by marking some cells as “dotted”, but, fortunately, it is outside the group for the options of the line.

```

4512 \group_begin:
4513   \@@_open_shorten:

```

```

4514     \keys_set:nn { NiceMatrix / xdots } { #3 }
4515     \tl_if_empty:oF \l_@@_xdots_color_tl { \color { \l_@@_xdots_color_tl } }
4516     \@@_actually_draw_Ddots:
4517     \group_end:
4518   }
4519 }
```

The command `\@@_actually_draw_Ddots:` has the following implicit arguments:

- `\l_@@_initial_i_int`
- `\l_@@_initial_j_int`
- `\l_@@_initial_open_bool`
- `\l_@@_final_i_int`
- `\l_@@_final_j_int`
- `\l_@@_final_open_bool.`

```

4520 \cs_new_protected:Npn \@@_actually_draw_Ddots:
4521 {
4522   \bool_if:NTF \l_@@_initial_open_bool
4523   {
4524     \@@_open_y_initial_dim:
4525     \@@_open_x_initial_dim:
4526   }
4527   { \@@_set_initial_coords_from_anchor:n { south-east } }
4528   \bool_if:NTF \l_@@_final_open_bool
4529   {

4532   }
4533   { \@@_set_final_coords_from_anchor:n { north-west } }
```

We have retrieved the coordinates in the usual way (they are stored in `\l_@@_x_initial_dim`, etc.). If the parallelization of the diagonals is set, we will have (maybe) to adjust the fourth coordinate.

```

4534 \bool_if:NT \l_@@_parallelize_diags_bool
4535 {
4536   \int_gincr:N \g_@@_ddots_int
```

We test if the diagonal line is the first one (the counter `\g_@@_ddots_int` is created for this usage).

```
4537   \int_compare:nNnTF \g_@@_ddots_int = \c_one_int
```

If the diagonal line is the first one, we have no adjustment of the line to do but we store the Δ_x and the Δ_y of the line because these values will be used to draw the others diagonal lines parallels to the first one.

```

4538   {
4539     \dim_gset:Nn \g_@@_delta_x_one_dim
4540     { \l_@@_x_final_dim - \l_@@_x_initial_dim }
4541     \dim_gset:Nn \g_@@_delta_y_one_dim
4542     { \l_@@_y_final_dim - \l_@@_y_initial_dim }
4543 }
```

If the diagonal line is not the first one, we have to adjust the second extremity of the line by modifying the coordinate `\l_@@_x_initial_dim`.

```

4544   {
4545     \dim_set:Nn \l_@@_y_final_dim
4546     {
4547       \l_@@_y_initial_dim +
4548       ( \l_@@_x_final_dim - \l_@@_x_initial_dim ) *
4549       \dim_ratio:nn \g_@@_delta_y_one_dim \g_@@_delta_x_one_dim
4550     }
4551   }
4552 }
```

`\@@_draw_line:`

```
4553 }
```

We draw the \Iddots diagonals in the same way.

The first and the second arguments are the coordinates of the cell where the command has been issued. The third argument is the list of the options.

```

4555 \cs_new_protected:Npn \@@_draw_Iddots:nnn #1 #2 #3

```

4599         }
4600     }
4601   }
4602 \@@_draw_line:
4603 }
```

18 The actual instructions for drawing the dotted lines with Tikz

The command `\@@_draw_line:` should be used in a `{pgfpicture}`. It has six implicit arguments:

- `\l_@@_x_initial_dim`
- `\l_@@_y_initial_dim`
- `\l_@@_x_final_dim`
- `\l_@@_y_final_dim`
- `\l_@@_initial_open_bool`
- `\l_@@_final_open_bool`

```

4604 \cs_new_protected:Npn \@@_draw_line:
4605 {
4606   \pgfrememberpicturepositiononpagetrue
4607   \pgf@relevantforpicturesizefalse
4608   \bool_lazy_or:nnTF
4609     { \tl_if_eq_p:NN \l_@@_xdots_line_style_tl \c_@@_standard_tl }
4610     \l_@@_dotted_bool
4611   \@@_draw_standard_dotted_line:
4612   \@@_draw_unstandard_dotted_line:
4613 }
```

We have to do a special construction with `\exp_args:N` to be able to put in the list of options in the correct place in the Tikz instruction.

```

4614 \cs_new_protected:Npn \@@_draw_unstandard_dotted_line:
4615 {
4616   \begin{scope}
4617     \@@_draw_unstandard_dotted_line:o
4618       { \l_@@_xdots_line_style_tl , \l_@@_xdots_color_tl }
4619 }
```

We have used the fact that, in PGF, un color name can be put directly in a list of options (that's why we have put diretly `\l_@@_xdots_color_tl`).

The argument of `\@@_draw_unstandard_dotted_line:n` is, in fact, the list of options.

```

4620 \cs_new_protected:Npn \@@_draw_unstandard_dotted_line:n #1
4621 {
4622   \@@_draw_unstandard_dotted_line:nooo
4623     { #1 }
4624   \l_@@_xdots_up_tl
4625   \l_@@_xdots_down_tl
4626   \l_@@_xdots_middle_tl
4627 }
4628 \cs_generate_variant:Nn \@@_draw_unstandard_dotted_line:n { o }
```

The following Tikz styles are for the three labels (set by the symbols `_`, `^` and `=`) of a continuous line with a non-standard style.

```

4629 \hook_gput_code:nnn { begindocument } { . }
4630 {
4631   \IfPackageLoadedTF { tikz }
4632   {
4633     \tikzset
4634     {
4635       @@_node_above / .style = { sloped , above } ,
4636       @@_node_below / .style = { sloped , below } ,
4637       @@_node_middle / .style =
4638       {
4639         sloped ,
4640         inner-sep = \c_@@_innersep_middle_dim
4641       }
4642     }
4643   }
4644   { }
4645 }

4646 \cs_new_protected:Npn \@@_draw_unstandard_dotted_line:nnnn #1 #2 #3 #4
4647 {

```

We take into account the parameters `xdots/shorten-start` and `xdots/shorten-end` “by hand” because, when we use the key `shorten >` and `shorten <` of TikZ in the command `\draw`, we don’t have the expected output with `{decorate, decoration=brace}` is used.

The dimension `\l_@@_l_dim` is the length ℓ of the line to draw. We use the floating point reals of the L3 programming layer to compute this length.

```

4648 \dim_zero_new:N \l_@@_l_dim
4649 \dim_set:Nn \l_@@_l_dim
4650 {
4651   \fp_to_dim:n
4652   {
4653     sqrt
4654     (
4655       ( \l_@@_x_final_dim - \l_@@_x_initial_dim ) ^ 2
4656       +
4657       ( \l_@@_y_final_dim - \l_@@_y_initial_dim ) ^ 2
4658     )
4659   }
4660 }

```

It seems that, during the first compilations, the value of `\l_@@_l_dim` may be erroneous (equal to zero or very large). We must detect these cases because they would cause errors during the drawing of the dotted line. Maybe we should also write something in the aux file to say that one more compilation should be done.

```

4661 \dim_compare:nNnT \l_@@_l_dim < \c_@@_max_l_dim
4662 {
4663   \dim_compare:nNnT \l_@@_l_dim > { 1 pt }
4664   \@@_draw_unstandard_dotted_line_i:

19 User commands available in the new environments

The commands `\@@_Ldots`, `\@@_Cdots`, `\@@_Vdots`, `\@@_Ddots` and `\@@_Idots` will be linked to `\Ldots`, `\Cdots`, `\Vdots`, `\Ddots` and `\Idots` in the environments `{NiceArray}` (the other environments of `nicematrix` rely upon `{NiceArray}`).

The syntax of these commands uses the character `_` as embellishment and that's why we have to insert a character `_` in the *arg spec* of these commands. However, we don't know the future catcode of `_` in the main document (maybe the user will use `underscore`, and, in that case, the catcode is 13 because `underscore` activates `_`). That's why these commands will be defined in a `\hook_gput_code:nnn { begindocument } { . }` and the *arg spec* will be rescanned.

```

4986 }

```

End of the \AddToHook.

Despite its name, the following set of keys will be used for \Ddots but also for \Iddots.

```

4987 \keys_define:nn { NiceMatrix / Ddots }
4988 {
4989   draw-first .bool_set:N = \l_@@_draw_first_bool ,
4990   draw-first .default:n = true ,
4991   draw-first .value_forbidden:n = true
4992 }

```

The command \@@_Hspace: will be linked to \hspace in {NiceArray}.

```

4993 \cs_new_protected:Npn \@@_Hspace:
4994 {
4995   \bool_gset_true:N \g_@@_empty_cell_bool
4996   \hspace
4997 }

```

In the environments of `nicematrix`, the command `\multicolumn` is redefined. We will patch the environment `{tabular}` to go back to the previous value of `\multicolumn`.

```
4998 \cs_set_eq:NN \@@_old_multicolumn \multicolumn
```

The command `\@@_Hdotsfor` will be linked to `\Hdotsfor` in `{NiceArrayWithDelims}`. Tikz nodes are created also in the implicit cells of the `\Hdotsfor` (maybe we should modify that point).

This command must *not* be protected since it begins with `\multicolumn`.

```
4999 \cs_new:Npn \@@_Hdotsfor:
5000 {
5001     \bool_lazy_and:nnTF
5002         { \int_if_zero_p:n \c@jCol }
5003         { \int_if_zero_p:n \l_@@_first_col_int }
5004     {
5005         \bool_if:NTF \g_@@_after_col_zero_bool
5006             {
5007                 \multicolumn { 1 } { c } { }
5008                 \@@_Hdotsfor_i
5009             }
5010             { \@@_fatal:n { Hdotsfor~in~col~0 } }
5011     }
5012     {
5013         \multicolumn { 1 } { c } { }
5014         \@@_Hdotsfor_i
5015     }
5016 }
```

The command `\@@_Hdotsfor_i` is defined with `\NewDocumentCommand` because it has an optional argument. Note that such a command defined by `\NewDocumentCommand` is protected and that's why we have put the `\multicolumn` before (in the definition of `\@@_Hdotsfor:`).

```
5017 \hook_gput_code:nnn { begindocument } { . }
5018 {
5019     \cs_set_nopar:Npn \l_@@_argspec_tl { m m 0 { } E { _ ^ : } { { } { } { } } }
5020     \tl_set_rescan:Nno \l_@@_argspec_tl { } \l_@@_argspec_tl
```

We don't put ! before the last optionnal argument for homogeneity with `\Cdots`, etc. which have only one optional argument.

```

5198 }

```

20 The command `\line` accessible in code-after

In the `\CodeAfter`, the command `\@@_line:nn` will be linked to `\line`. This command takes two arguments which are the specifications of two cells in the array (in the format $i-j$) and draws a dotted line between these cells. In fact, it also works with names of blocks.

First, we write a command with the following behaviour:

- If the argument is of the format $i-j$, our command applies the command `\int_eval:n` to i and j ;
- If not (that is to say, when it's a name of a `\Block`), the argument is left unchanged.

This must *not* be protected (and is, of course fully expandable).¹³

```

5199 \cs_new:Npn \@@_double_int_eval:n #1-#2 \q_stop
5200 {
5201   \tl_if_empty:nTF { #2 }
5202   { #1 }
5203   { \@@_double_int_eval_i:n #1-#2 \q_stop }
5204 }
5205 \cs_new:Npn \@@_double_int_eval_i:n #1-#2- \q_stop
5206 { \int_eval:n { #1 } - \int_eval:n { #2 } }
```

With the following construction, the command `\@@_double_int_eval:n` is applied to both arguments before the application of `\@@_line_i:nn` (the construction uses the fact the `\@@_line_i:nn` is protected and that `\@@_double_int_eval:n` is fully expandable).

```

The test of `measuring@` is a security (cf. question 686649 on TeX StackExchange).

```

5234   { \legacy_if:nF { measuring@ } { \@@_draw_line_ii:nn { #1 } { #2 } } }
5235 }

5236 \hook_gput_code:nnn { begindocument } { . }
5237 {
5238   \cs_new_protected:Npx \@@_draw_line_ii:nn #1 #2
5239   {
```

We recall that, when externalization is used, `\tikzpicture` and `\endtikzpicture` (or `\pgfpicture` and `\endpgfpicture`) must be directly “visible” and that why we do this static construction of the command `\@@_draw_line_ii:`.

```

5240   \c_@@_pgfortikzpicture_tl
5241   \@@_draw_line_iii:nn { #1 } { #2 }
```

¹³Indeed, we want that the user may use the command `\line` in `\CodeAfter` with LaTeX counters in the arguments — with the command `\value`.

```

5242     \c_@@_endpgfornikzpicture_tl
5243 }
5244 }
```

The following command *must* be protected (it's used in the construction of `\@@_draw_line_ii:nn`).

```

5245 \cs_new_protected:Npn \@@_draw_line_iii:nn #1 #2
5246 {
5247     \pgfrememberpicturepositiononpagetrue
5248     \pgfpointshapeborder { \@@_env: - #1 } { \@@_qpoint:n { #2 } }
5249     \dim_set_eq:NN \l_@@_x_initial_dim \pgf@x
5250     \dim_set_eq:NN \l_@@_y_initial_dim \pgf@y
5251     \pgfpointshapeborder { \@@_env: - #2 } { \@@_qpoint:n { #1 } }
5252     \dim_set_eq:NN \l_@@_x_final_dim \pgf@x
5253     \dim_set_eq:NN \l_@@_y_final_dim \pgf@y
5254     \@@_draw_line:
5255 }
```

The commands `\Ldots`, `\Cdots`, `\Vdots`, `\Ddots`, and `\Iddots` don't use this command because they have to do other settings (for example, the diagonal lines must be parallelized).

21 The command `\RowStyle`

`\g_@@_row_style_tl` may contain several instructions of the form:

```
\@@_if_row_less_than:nn { number } { instructions }
```

Then, `\g_@@_row_style_tl` will be inserted in all the cells of the array (and also in both components of a `\diagbox` in a cell of in a mono-row block).

The test `\@@_if_row_less_then:nn` ensures that the instructions are inserted only if you are in a row which is (still) in the scope of that instructions (which depends on the value of the key `nb-rows` of `\RowStyle`).

That test will be active even in an expandable context because `\@@_if_row_less_then:nn` is *not* protected.

#1 is the first row *after* the scope of the instructions in #2

```

5256 \cs_new:Npn \@@_if_row_less_than:nn #1 #2
5257 { \int_compare:nNnT { \c@iRow } < { #1 } { #2 } }
```

`\@@_put_in_row_style` will be used several times by `\RowStyle`.

```

5258 \cs_set_protected:Npn \@@_put_in_row_style:n #1
5259 {
5260     \tl_gput_right:Nx \g_@@_row_style_tl
5261 }
```

Be careful, `\exp_not:N \@@_if_row_less_than:nn` can't be replaced by a protected version of `\@@_if_row_less_than:nn`.

```

5262     \exp_not:N
5263     \@@_if_row_less_than:nn
5264     { \int_eval:n { \c@iRow + \l_@@_key_nb_rows_int } }
```

The `\scan_stop:` is mandatory (for ex. for the case where `\rotate` is used in the argument of `\RowStyle`).

```

5265     { \exp_not:n { #1 } \scan_stop: }
5266 }
5267 }
5268 \cs_generate_variant:Nn \@@_put_in_row_style:n { e }
```

```

5269 \keys_define:nn { NiceMatrix / RowStyle }
5270 {
5271   cell-space-top-limit .dim_set:N = \l_tmpa_dim ,

5371   \ignorespaces
5372 }
```

22 Colors of cells, rows and columns

We want to avoid the thin white lines that are shown in some PDF viewers (eg: with the engine MuPDF used by SumatraPDF). That's why we try to draw rectangles of the same color in the same instruction `\pgfusepath { fill }` (and they will be in the same instruction `fill`—coded `f`—in the resulting PDF).

The commands `\@@_rowcolor`, `\@@_columncolor`, `\@@_rectanglecolor` and `\@@_rowlistcolors` don't directly draw the corresponding rectangles. Instead, they store their instructions color by color:

- A sequence `\g_@@_colors_seq` will be built containing all the colors used by at least one of these instructions. Each *color* may be prefixed by its color model (eg: `[gray]{0.5}`).
- For the color whose index in `\g_@@_colors_seq` is equal to *i*, a list of instructions which use that color will be constructed in the token list `\g_@@_color_i_t1`. In that token list, the instructions will be written using `\@@_cartesian_color:nn` and `\@@_rectanglecolor:nn`.

#1 is the color and #2 is an instruction using that color. Despite its name, the command `\@@_add_to_colors_seq:nn` doesn't only add a color to `\g_@@_colors_seq`: it also updates the corresponding token list `\g_@@_color_i_t1`. We add in a global way because the final user may use the instructions such as `\cellcolor` in a loop of `pgffor` in the `\CodeBefore` (and we recall that a loop of `pgffor` is encapsulated in a group).

```
5373 \cs_new_protected:Npn \@@_add_to_colors_seq:nn #1 #2
5374 {
```

Firt, we look for the number of the color and, if it's found, we store it in `\l_tmpa_int`. If the color is not present in `\l_@@_colors_seq`, `\l_tmpa_int` will remain equal to 0.

```
5375 \int_zero:N \l_tmpa_int
```

We don't take into account the colors like `myserie!!+` because those colors are special color from a `\definecolorseries` of `xcolor`.

```
5376 \str_if_in:nnF { #1 } { !! }
5377 {
5378   \seq_map_indexed_inline:Nn \g_@@_colors_seq
5379     { \tl_if_eq:nnT { #1 } { ##2 } { \int_set:Nn \l_tmpa_int { ##1 } } }
5380   }
5381 \int_if_zero:nTF \l_tmpa_int
```

First, the case where the color is a *new* color (not in the sequence).

```
5382 {
5383   \seq_gput_right:Nn \g_@@_colors_seq { #1 }
5384   \tl_gset:cx { g_@@_color _ \seq_count:N \g_@@_colors_seq _ tl } { #2 }
5385 }
```

Now, the case where the color is *not* a new color (the color is in the sequence at the position `\l_tmpa_int`).

```
5386   { \tl_gput_right:cx { g_@@_color _ \int_use:N \l_tmpa_int _ tl } { #2 } }
5387 }
5388 \cs_generate_variant:Nn \@@_add_to_colors_seq:nn { e n }
5389 \cs_generate_variant:Nn \@@_add_to_colors_seq:nn { e e }
```

The following command must be used within a `\pgfpicture`.

```
5390 \cs_new_protected:Npn \@@_clip_with_rounded_corners:
5391 {
5392   \dim_compare:nNnT \l_@@_tab_rounded_corners_dim > \c_zero_dim
5393   {
```

The TeX group is for `\pgfsetcornersarced` (whose scope is the TeX scope).

```

5394 \group_begin:
5395 \pgfsetcornersarced
5396 {
5397     \pgfpoint
5398     { \l_@@_tab_rounded_corners_dim }
5399     { \l_@@_tab_rounded_corners_dim }
5400 }
```

Because we want `nicematrix` compatible with arrays constructed by `array`, the nodes for the rows and columns (that is to say the nodes `row-i` and `col-j`) have not always the expected position, that is to say, there is sometimes a slight shifting of something such as `\arrayrulewidth`. Now, for the clipping, we have to change slightly the position of that clipping whether a rounded rectangle around the array is required. That's the point which is tested in the following line.

```

5401 \bool_if:NTF \l_@@_hvlines_bool
5402 {
5403     \pgfpathrectanglecorners
5404     {
5405         \pgfpointadd
5406         { \c@_qpoint:n { row-1 } }
5407         { \pgfpoint { 0.5 \arrayrulewidth } { \c_zero_dim } }
5408     }
5409     {
5410         \pgfpointadd
5411         {
5412             \c@_qpoint:n
5413             { \int_eval:n { \int_max:nn \c@iRow \c@jCol + 1 } }
5414         }
5415         { \pgfpoint \c_zero_dim { 0.5 \arrayrulewidth } }
5416     }
5417 }
5418 {
5419     \pgfpathrectanglecorners
5420     { \c@_qpoint:n { row-1 } }
5421     {
5422         \pgfpointadd
5423         {
5424             \c@_qpoint:n
5425             { \int_eval:n { \int_max:nn \c@iRow \c@jCol + 1 } }
5426         }
5427         { \pgfpoint \c_zero_dim \arrayrulewidth }
5428     }
5429 }
5430 \pgfusepath { clip }
5431 \group_end:
```

The TeX group was for `\pgfsetcornersarced`.

```

5432 }
5433 }
```

The macro `\c@_actually_color:` will actually fill all the rectangles, color by color (using the sequence `\l_@@_colors_seq` and all the token lists of the form `\l_@@_color_i_t1`).

```

5434 \cs_new_protected:Npn \c@_actually_color:
5435 {
5436     \pgfpicture
5437     \pgf@relevantforpicturesizefalse
```

If the final user has used the key `rounded-corners` for the environment `{NiceTabular}`, we will clip to a rectangle with rounded corners before filling the rectangles.

```

5438 \c@_clip_with_rounded_corners:
5439 \seq_map_indexed_inline:Nn \g_@@_colors_seq
5440 {
5441     \int_compare:nNnTF { ##1 } = \c_one_int
```

```

5442 {
5443   \cs_set_eq:NN \@@_cartesian_path:n \@@_cartesian_path_nocolor:n
5444   \use:c { g_@@_color _ 1 _tl }
5445   \cs_set_eq:NN \@@_cartesian_path:n \@@_cartesian_path_normal:n
5446 }
5447 {
5448   \begin { pgfscope }
5449     \@@_color_opacity ##2
5450     \use:c { g_@@_color _ ##1 _tl }
5451     \tl_gclear:c { g_@@_color _ ##1 _tl }
5452     \pgfusepath { fill }
5453   \end { pgfscope }
5454 }
5455 }
5456 \endpgfpicture
5457 }
```

The following command will extract the potential key `opacity` in its optional argument (between square brackets) and (of course) then apply the command `\color`.

```

5458 \cs_new_protected:Npn \@@_color_opacity
5459 {
5460   \peek_meaning:NTF [
5461     { \@@_color_opacity:w }
5462     { \@@_color_opacity:w [ ] }
5463 }
```

The command `\@@_color_opacity:w` takes in as argument only the optional argument. One may consider that the second argument (the actual definition of the color) is provided by curryfication.

```

5464 \cs_new_protected:Npn \@@_color_opacity:w [ #1 ]
5465 {
5466   \tl_clear:N \l_tmpa_tl
5467   \keys_set_known:nnN { nicematrix / color-opacity } { #1 } \l_tmpb_tl
\l_tmpa_tl (if not empty) is now the opacity and \l_tmpb_tl (if not empty) is now the colorimetric space.
5468   \tl_if_empty:NF \l_tmpa_tl { \exp_args:No \pgfsetfillopacity \l_tmpa_tl }

```

The command \@@_cartesian_path:n takes in two implicit arguments: \l_@@_cols_tl and \l_@@_rows_tl.

```

5530   \@@_cartesian_path:n { #3 }
5531 }

```

Here is an example : \@@_cellcolor[rgb]{0.5,0.5,0}{2-3,3-4,4-5,5-6}

```

5532 \NewDocumentCommand \@@_cellcolor { 0 { } m m }
5533 {
5534   \clist_map_inline:nn { #3 }
5535   { \@@_rectanglecolor [ #1 ] { #2 } { ##1 } { ##1 } }
5536 }

```

```

5537 \NewDocumentCommand \@@_chessboardcolors { 0 { } m m }
5538 {
5539   \int_step_inline:nn \c@iRow
5540   {
5541     \int_step_inline:nn \c@jCol
5542     {
5543       \int_if_even:nTF { #####1 + ##1 }
5544       { \@@_cellcolor [ #1 ] { #2 } }
5545       { \@@_cellcolor [ #1 ] { #3 } }
5546       { ##1 - #####1 }
5547     }
5548   }
5549 }

```

The command `\@@_arraycolor` (linked to `\arraycolor` at the beginning of the `\CodeBefore`) will color the whole tabular (excepted the potential exterior rows and columns) and the cells in the “corners”.

```

5550 \NewDocumentCommand \@@_arraycolor { 0 { } m }
5551 {
5552   \@@_rectanglecolor [ #1 ] { #2 }
5553   { 1 - 1 }
5554   { \int_use:N \c@iRow - \int_use:N \c@jCol }
5555 }

5556 \keys_define:nn { NiceMatrix / rowcolors }
5557 {
5558   respect-blocks .bool_set:N = \l_@@_respect_blocks_bool ,
5559   respect-blocks .default:n = true ,
5560   cols .tl_set:N = \l_@@_cols_tl ,
5561   restart .bool_set:N = \l_@@_rowcolors_restart_bool ,
5562   restart .default:n = true ,
5563   unknown .code:n = \@@_error:n { Unknown~key~for~rowcolors }
5564 }

```

The command `\rowcolors` (accessible in the `\CodeBefore`) is inspired by the command `\rowcolors` of the package `xcolor` (with the option `table`). However, the command `\rowcolors` of `nicematrix` has *not* the optional argument of the command `\rowcolors` of `xcolor`.

Here is an example: `\rowcolors{1}{blue!10}{red}[respect-blocks]`.

In `nicematrix`, the command `\@@_rowcolors` appears as a special case of `\@@_rowlistcolors`. #1 (optional) is the color space; #2 is a list of intervals of rows; #3 is the list of colors; #4 is for the optional list of pairs `key=value`.

```

5565 \NewDocumentCommand \@@_rowlistcolors { 0 { } m m 0 { } }
5566 {

```

The group is for the options. `\l_@@_colors_seq` will be the list of colors.

```

5567 \group_begin:
5568 \seq_clear_new:N \l_@@_colors_seq
5569 \seq_set_split:Nnn \l_@@_colors_seq { , } { #3 }
5570 \tl_clear_new:N \l_@@_cols_tl
5571 \cs_set_nopar:Npn \l_@@_cols_tl { - }
5572 \keys_set:nn { NiceMatrix / rowcolors } { #4 }

```

The counter `\l_@@_color_int` will be the rank of the current color in the list of colors (modulo the length of the list).

```

5573 \int_zero_new:N \l_@@_color_int
5574 \int_set_eq:NN \l_@@_color_int \c_one_int
5575 \bool_if:NT \l_@@_respect_blocks_bool
5576 {

```

We don't want to take into account a block which is completely in the "first column" (number 0) or in the "last column" and that's why we filter the sequence of the blocks (in a the sequence `\l_tmpa_seq`).

```

5577   \seq_set_eq:NN \l_tmpb_seq \g_@@_pos_of_blocks_seq
5578   \seq_set_filter:NNn \l_tmpa_seq \l_tmpb_seq
5579     { \@@_not_in_exterior_p:nnnn ##1 }
5580   }
5581   \pgfpicture
5582   \pgf@relevantforpicturesizefalse

```

#2 is the list of intervals of rows.

```

5583   \clist_map_inline:nn { #2 }
5584   {
5585     \cs_set_nopar:Npn \l_tmpa_tl { ##1 }
5586     \tl_if_in:NnTF \l_tmpa_tl { - }
5587       { \@@_cut_on_hyphen:w ##1 \q_stop }
5588       { \tl_set:No \l_tmpb_tl { \int_use:N \c@iRow } }

```

Now, `\l_tmpa_tl` and `\l_tmpb_tl` are the first row and the last row of the interval of rows that we have to treat. The counter `\l_tmpa_int` will be the index of the loop over the rows.

```

5589   \int_set:Nn \l_tmpa_int \l_tmpa_tl
5590   \int_set:Nn \l_@@_color_int
5591     { \bool_if:NTF \l_@@_rowcolors_restart_bool 1 \l_tmpa_tl }
5592   \int_zero_new:N \l_@@_tmpc_int
5593   \int_set:Nn \l_@@_tmpc_int \l_tmpb_tl
5594   \int_do_until:nNnn \l_tmpa_int > \l_@@_tmpc_int
5595   {

```

We will compute in `\l_tmpb_int` the last row of the "block".

```
5596   \int_set_eq:NN \l_tmpb_int \l_tmpa_int
```

If the key `respect-blocks` is in force, we have to adjust that value (of course).

```

5597   \bool_if:NT \l_@@_respect_blocks_bool
5598   {
5599     \seq_set_filter:NNn \l_tmpb_seq \l_tmpa_seq
5600       { \@@_intersect_our_row_p:nnnnn #####1 }
5601     \seq_map_inline:Nn \l_tmpb_seq { \@@_rowcolors_i:nnnnn #####1 }

```

Now, the last row of the block is computed in `\l_tmpb_int`.

```

5602   }
5603   \tl_set:No \l_@@_rows_tl
5604   { \int_use:N \l_tmpa_int - \int_use:N \l_tmpb_int }

```

`\l_@@_tmpc_tl` will be the color that we will use.

```

5605   \tl_clear_new:N \l_@@_color_tl
5606   \tl_set:Nx \l_@@_color_tl
5607   {
5608     \@@_color_index:n

5826     { \int_use:N \c@iRow - \exp_not:n { \int_use:N \c@jCol } }
5827   }
5828   \ignorespaces
5829 }
```

When the user uses the key `color-inside`, the following command will be linked to `\rowcolors` in the tabular. The last argument (an optional argument between square brackets is taken by curryfication).

```

5830 \NewDocumentCommand { \@@_rowcolors_tabular } { 0 { } m m }
5831   { \@@_rowlistcolors_tabular [ #1 ] { { #2 } , { #3 } } }
```

The braces around #2 and #3 are mandatory.

When the user uses the key `color-inside`, the following command will be linked to `\rowlistcolors` in the tabular.

```

5832 \NewDocumentCommand { \@@_rowlistcolors_tabular } { 0 { } m 0 { } }
5833 {
5834   \@@_test_color_inside:
5835   \peek_remove_spaces:n
5836   { \@@_rowlistcolors_tabular:nnn { #1 } { #2 } { #3 } }
5837 }

5838 \cs_new_protected:Npn \@@_rowlistcolors_tabular:nnn #1 #2 #3
5839 {
```

A use of `\rowlistcolors` in the tabular erases the instructions `\rowlistcolors` which are in force. However, it's possible to put *several* instructions `\rowlistcolors` in the same row of a tabular: it may be useful when those instructions `\rowlistcolors` concerns different columns of the tabular (thanks to the key `cols` of `\rowlistcolors`). That's why we store the different instructions `\rowlistcolors` which are in force in a sequence `\g_@@_rowlistcolors_seq`. Now, we will filter that sequence to keep only the elements which have been issued on the actual row. We will store the elements to keep in the `\g_tmpa_seq`.

```

5840 \seq_gclear:N \g_tmpa_seq
5841 \seq_map_inline:Nn \g_@@_rowlistcolors_seq
5842   { \@@_rowlistcolors_tabular_i:nnnn ##1 }
5843 \seq_gset_eq:NN \g_@@_rowlistcolors_seq \g_tmpa_seq
```

Now, we add to the sequence `\g_@@_rowlistcolors_seq` (which is the list of the commands `\rowlistcolors` which are in force) the current instruction `\rowlistcolors`.

```

5844 \seq_gput_right:Nx \g_@@_rowlistcolors_seq
5845 {
5846   { \int_use:N \c@iRow }
5847   { \exp_not:n { #1 } }
5848   { \exp_not:n { #2 } }
5849   { restart , cols = \int_use:N \c@jCol - , \exp_not:n { #3 } }
5850 }
5851 }
```

The following command will be applied to each component of `\g_@@_rowlistcolors_seq`. Each component of that sequence is a kind of 4-uple of the form `{#1}{#2}{#3}{#4}`.

#1 is the number of the row where the command `\rowlistcolors` has been issued.

#2 is the colorimetric space (optional argument of the `\rowlistcolors`).

#3 is the list of colors (mandatory argument of `\rowlistcolors`).

#4 is the list of key=value pairs (last optional argument of \rowlistcolors).

```
5852 \cs_new_protected:Npn \@@_rowlistcolors_tabular_i:nnnn #1 #2 #3 #4
5853 {
5854     \int_compare:nNnT { #1 } = \c@iRow
```

We (temporary) keep in memory in \g_tmpa_seq the instructions which will still be in force after the current instruction (because they have been issued in the same row of the tabular).

```
5855     { \seq_gput_right:Nn \g_tmpa_seq { { #1 } { #2 } { #3 } { #4 } } }
5856     {
5857         \tl_gput_right:Nx \g_@@_pre_code_before_tl
5858         {
5859             \@@_rowlistcolors
5860             [ \exp_not:n { #2 } ]
5861             { #1 - \int_eval:n { \c@iRow - 1 } }
5862             { \exp_not:n { #3 } }
5863             [ \exp_not:n { #4 } ]
5864         }
5865     }
5866 }
```

The following command will be used at the end of the tabular, just before the execution of the \g_@@_pre_code_before_tl. It clears the sequence \g_@@_rowlistcolors_seq of all the commands \rowlistcolors which are (still) in force.

```
5867 \cs_new_protected:Npn \@@_clear_rowlistcolors_seq:
5868 {
5869     \seq_map_inline:Nn \g_@@_rowlistcolors_seq
5870     { \@@_rowlistcolors_tabular_ii:nnnn ##1 }
5871     \seq_gclear:N \g_@@_rowlistcolors_seq
5872 }

5873 \cs_new_protected:Npn \@@_rowlistcolors_tabular_ii:nnnn #1 #2 #3 #4
5874 {
5875     \tl_gput_right:Nn \g_@@_pre_code_before_tl
5876     { \@@_rowlistcolors [ #2 ] { #1 } { #3 } [ #4 ] }
5877 }
```

The first mandatory argument of the command \@@_rowlistcolors which is written in the pre-\CodeBefore is of the form i: it means that the command must be applied to all the rows from the row *i* until the end of the tabular.

```
5878 \NewDocumentCommand \@@_columncolor_preamble { O{ } m }
5879 {
```

With the following line, we test whether the cell is the first one we encounter in its column (don't forget that some rows may be incomplete).

```
5880 \int_compare:nNnT \c@jCol > \g_@@_col_total_int
5881 {
```

You use gput_left because we want the specification of colors for the columns drawn before the specifications of color for the rows (and the cells). Be careful: maybe this is not effective since we have an analyze of the instructions in the \CodeBefore in order to fill color by color (to avoid the thin white lines).

```
5882 \tl_gput_left:Nx \g_@@_pre_code_before_tl
5883 {
5884     \exp_not:N \columncolor [ #1 ]
5885     { \exp_not:n { #2 } } { \int_use:N \c@jCol }
5886 }
5887 }
5888 }
```

```

5904   { \cs_new_protected:Npn \@@_revert_colortbl: { } }
5905 }

```

23 The vertical and horizontal rules

OnlyMainNiceMatrix

We give to the user the possibility to define new types of columns (with `\newcolumntype` of `array`) for special vertical rules (*e.g.* rules thicker than the standard ones) which will not extend in the potential exterior rows of the array.

We provide the command `\OnlyMainNiceMatrix` in that goal. However, that command must be no-op outside the environments of `nicematrix` (and so the user will be allowed to use the same new type of column in the environments of `nicematrix` and in the standard environments of `array`).

That's why we provide first a global definition of `\OnlyMainNiceMatrix`.

```
5906 \cs_set_eq:NN \OnlyMainNiceMatrix \use:
```

Another definition of `\OnlyMainNiceMatrix` will be linked to the command in the environments of `nicematrix`. Here is that definition, called `\@@_OnlyMainNiceMatrix:n`.

```

5907 \cs_new_protected:Npn \@@_OnlyMainNiceMatrix:n #
5908 {
5909   \int_if_zero:nTF \l_@@_first_col_int
5910   { \@@_OnlyMainNiceMatrix_i:n { #1 } }
5911   {
5912     \int_if_zero:nTF \c@jCol
5913     {
5914       \int_compare:nNnf \c@iRow = { -1 }
5915       { \int_compare:nNnf \c@iRow = { \l_@@_last_row_int - 1 } { #1 } }
5916     }
5917     { \@@_OnlyMainNiceMatrix_i:n { #1 } }
5918   }
5919 }
```

This definition may seem complicated but we must remind that the number of row `\c@iRow` is incremented in the first cell of the row, *after* a potential vertical rule on the left side of the first cell. The command `\@@_OnlyMainNiceMatrix_i:n` is only a short-cut which is used twice in the above command. This command must *not* be protected.

```

5920 \cs_new_protected:Npn \@@_OnlyMainNiceMatrix_i:n #
5921 {
5922   \int_if_zero:nF \c@iRow
5923   {
5924     \int_compare:nNnf \c@iRow = \l_@@_last_row_int
5925     {
```

```

5926     \int_compare:nNnT \c@jCol > \c_zero_int
5927         { \bool_if:NF \l_@@_in_last_col_bool { #1 } }
5928     }
5929 }
5930 }
```

Remember that `\c@iRow` is not always inferior to `\l_@@_last_row_int` because `\l_@@_last_row_int` may be equal to -2 or -1 (we can't write `\int_compare:nNnT \c@iRow < \l_@@_last_row_int`).

General system for drawing rules

When a command, environment or “subsystem” of `nicematrix` wants to draw a rule, it will write in the internal `\CodeAfter` a command `\@@_vline:n` or `\@@_hline:n`. Both commands take in as argument a list of `key=value` pairs. That list will first be analyzed with the following set of keys. However, unknown keys will be analyzed further with another set of keys.

```

5931 \keys_define:nn { NiceMatrix / Rules }
5932 {
5933     position .int_set:N = \l_@@_position_int ,
5934     position .value_required:n = true ,
5935     start .int_set:N = \l_@@_start_int ,
5936     end .code:n =
5937         \bool_lazy_or:nnTF
5938             { \tl_if_empty_p:n { #1 } }
5939             { \str_if_eq_p:nn { #1 } { last } }
5940             { \int_set_eq:NN \l_@@_end_int \c@jCol }
5941             { \int_set:Nn \l_@@_end_int { #1 } }
5942 }
```

It's possible that the rule won't be drawn continuously from `start` or `end` because of the blocks (created with the command `\Block`), the virtual blocks (created by `\Cdots`, etc.), etc. That's why an analyse is done and the rule is cut in small rules which will actually be drawn. The small continuous rules will be drawn by `\@@_vline_ii:` and `\@@_hline_ii::`. Those commands use the following set of keys.

```

5943 \keys_define:nn { NiceMatrix / RulesBis }
5944 {
5945     multiplicity .int_set:N = \l_@@_multiplicity_int ,
5946     multiplicity .initial:n = 1 ,
5947     dotted .bool_set:N = \l_@@_dotted_bool ,
5948     dotted .initial:n = false ,
5949     dotted .default:n = true ,
```

We want that, even when the rule has been defined with TikZ by the key `tikz`, the user has still the possibility to change the color of the rule with the key `color` (in the command `\Hline`, not in the key `tikz` of the command `\Hline`). The main use is, when the user has defined its own command `\MyDashedLine` by `\newcommand{\MyDashedRule}{\Hline[tikz=dashed]}`, to give the ability to write `\MyDashedRule[color=red]`.

```

5950     color .code:n =
5951         \@@_set_Carc@:n { #1 }
5952         \tl_set:Nn \l_@@_rule_color_tl { #1 } ,
5953     color .value_required:n = true ,
5954     sep-color .code:n = \@@_set_Cdrsc@:n { #1 } ,
5955     sep-color .value_required:n = true ,
```

If the user uses the key `tikz`, the rule (or more precisely: the different sub-rules since a rule may be broken by blocks or others) will be drawn with Tikz.

```

5956     tikz .code:n =
5957         \IfPackageLoadedTF { tikz }
5958             { \clist_put_right:Nn \l_@@_tikz_rule_tl { #1 } }
5959             { \@@_error:n { tikz-without-tikz } } ,
5960     tikz .value_required:n = true ,
5961     total-width .dim_set:N = \l_@@_rule_width_dim ,
```

```

5962     total-width .value_required:n = true ,
5963     width .meta:n = { total-width = #1 } ,
5964     unknown .code:n = \@@_error:n { Unknown-key-for-RulesBis }
5965 }
```

The vertical rules

The following command will be executed in the internal `\CodeAfter`. The argument `#1` is a list of `key=value` pairs.

```

5966 \cs_new_protected:Npn \@@_vline:n #1
5967 {
```

The group is for the options.

```

5968 \group_begin:

The following code is for the case of a dotted rule (with our system of rounded dots). The aim is that, by standard the dotted line fits between square brackets (`\hline` doesn't).

```

\begin{bNiceMatrix}
1 & 2 & 3 & 4 \\
\hline
1 & 2 & 3 & 4 \\
\hdottedline
1 & 2 & 3 & 4
\end{bNiceMatrix}

```

$$\left[\begin{array}{cccc} 1 & 2 & 3 & 4 \\ 1 & 2 & 3 & 4 \\ \vdots & \vdots & \ddots & \vdots \\ 1 & 2 & 3 & 4 \end{array} \right]$$

But, if the user uses `margin`, the dotted line extends to have the same width as a `\hline`.

```
\begin{bNiceMatrix}[margin]
```

```

1 & 2 & 3 & 4 \\
\hline
1 & 2 & 3 & 4 \\
\hdottedline
1 & 2 & 3 & 4
\end{bNiceMatrix}

```

$$\left[\begin{array}{cccc} 1 & 2 & 3 & 4 \\ 1 & 2 & 3 & 4 \\ \vdots & \vdots & \ddots & \vdots \\ 1 & 2 & 3 & 4 \end{array} \right]$$

6383     \egroup
6384 }
```

Customized rules defined by the final user

The final user can define a customized rule by using the key `custom-line` in `\NiceMatrixOptions`. That key takes in as value a list of `key=value` pairs.

The following command will create the customized rule (it is executed when the final user uses the key `custom-line`, for example in `\NiceMatrixOptions`).

```

6385 \cs_new_protected:Npn \@@_custom_line:n #1
6386 {
6387     \str_clear_new:N \l_@@_command_str
6388     \str_clear_new:N \l_@@_ccommand_str
6389     \str_clear_new:N \l_@@_letter_str
6390     \tl_clear_new:N \l_@@_other_keys_tl
6391     \keys_set_known:nnN { NiceMatrix / custom-line } { #1 } \l_@@_other_keys_tl
```

If the final user only wants to draw horizontal rules, he does not need to specify a letter (for the vertical rules in the preamble of the array). On the other hand, if he only wants to draw vertical rules, he does not need to define a command (which is the tool to draw horizontal rules in the array). Of course, a definition of custom lines with no letter and no command would be point-less.

```

6392 \bool_lazy_all:nTF

6644 }
```

“Computing a corner” is determining all the empty cells (which are not in a block) that belong to that corner. These cells will be added to the sequence `\l_@@_corners_cells_seq`.

The six arguments of `\@@_compute_a_corner:nnnnnn` are as follow:

- #1 and #2 are the number of row and column of the cell which is actually in the corner;
- #3 and #4 are the steps in rows and the step in columns when moving from the corner;
- #5 is the number of the final row when scanning the rows from the corner;
- #6 is the number of the final column when scanning the columns from the corner.

```

6646 \cs_new_protected:Npn \@@_compute_a_corner:nnnnnn #1 #2 #3 #4 #5 #6
6647 {
```

For the explanations and the name of the variables, we consider that we are computing the left-upper corner.

First, we try to determine which is the last empty cell (and not in a block: we won't add that precision any longer) in the column of number 1. The flag `\l_tmpa_bool` will be raised when a non-empty cell is found.

```

6648  \bool_set_false:N \l_tmpa_bool

6653      @@@_test_if_cell_in_a_block:nn { ##1 } { \int_eval:n { #2 } }
6654      \bool_lazy_or:mnTF
6655      {
6656          \cs_if_exist_p:c
6657          { pgf @ sh @ ns @ \@@_env: - ##1 - \int_eval:n { #2 } }
6658      }
6659      \l_tmpb_bool
6660      { \bool_set_true:N \l_tmpa_bool }
6661      {
6662          \bool_if:NF \l_tmpa_bool
6663          { \int_set:Nn \l_@@_last_empty_row_int { ##1 } }
6664      }
6665  }

```

Now, you determine the last empty cell in the row of number 1.

```

6666  \bool_set_false:N \l_tmpa_bool
6667  \int_zero_new:N \l_@@_last_empty_column_int
6668  \int_set:Nn \l_@@_last_empty_column_int { #2 }
6669  \int_step_inline:nnnn { #2 } { #4 } { #6 }
6670  {
6671      @@@_test_if_cell_in_a_block:nn { \int_eval:n { #1 } } { ##1 }
6672      \bool_lazy_or:mnTF
6673      \l_tmpb_bool
6674      {
6675          \cs_if_exist_p:c
6676          { pgf @ sh @ ns @ \@@_env: - \int_eval:n { #1 } - ##1 }
6677      }
6678      { \bool_set_true:N \l_tmpa_bool }
6679      {
6680          \bool_if:NF \l_tmpa_bool
6681          { \int_set:Nn \l_@@_last_empty_column_int { ##1 } }
6682      }
6683  }

```

Now, we loop over the rows.

```

6684  \int_step_inline:nnnn { #1 } { #3 } \l_@@_last_empty_row_int
6685  {

```

We treat the row number `##1` with another loop.

```

6686  \bool_set_false:N \l_tmpa_bool
6687  \int_step_inline:nnnn { #2 } { #4 } \l_@@_last_empty_column_int
6688  {
6689      @@@_test_if_cell_in_a_block:nn { ##1 } { #####1 }
6690      \bool_lazy_or:mnTF
6691      \l_tmpb_bool
6692      {
6693          \cs_if_exist_p:c
6694          { pgf @ sh @ ns @ \@@_env: - ##1 - #####1 }

6703           { ##1 - #####1 }
6704       }
6705   }
6706 }
6707 }
6708 }

```

The following macro tests whether a cell is in (at least) one of the blocks of the array (or in a cell with a `\diagbox`).

The flag `\l_tmpb_bool` will be raised if the cell #1-#2 is in a block (or in a cell with a `\diagbox`).

```

6709 \cs_new_protected:Npn \@@_test_if_cell_in_a_block:nn #1 #2
6710 {
6711     \int_set:Nn \l_tmpa_int { #1 }
6712     \int_set:Nn \l_tmpb_int { #2 }
6713     \bool_set_false:N \l_tmpb_bool
6714     \seq_map_inline:Nn \g_@@_pos_of_blocks_seq
6715     { \@@_test_if_cell_in_block:nnnnnnn \l_tmpa_int \l_tmpb_int ##1 }
6716 }

6717 \cs_set_protected:Npn \@@_test_if_cell_in_block:nnnnnnn #1 #2 #3 #4 #5 #6 #7
6718 {
6719     \int_compare:nNnF { #3 } > { #1 }
6720     {
6721         \int_compare:nNnF { #1 } > { #5 }
6722         {
6723             \int_compare:nNnF { #4 } > { #2 }
6724             {
6725                 \int_compare:nNnF { #2 } > { #6 }
6726                 { \bool_set_true:N \l_tmpb_bool }
6727             }
6728         }
6729     }
6730 }

```

25 The environment `{NiceMatrixBlock}`

The following flag will be raised when all the columns of the environments of the block must have the same width in “auto” mode.

```
6731 \bool_new:N \l_@@_block_auto_columns_width_bool
```

Up to now, there is only one option available for the environment `{NiceMatrixBlock}`.

```

6732 \keys_define:nn { NiceMatrix / NiceMatrixBlock }
6733 {
6734     auto-columns-width .code:n =
6735     {
6736         \bool_set_true:N \l_@@_block_auto_columns_width_bool
6737         \dim_gzero_new:N \g_@@_max_cell_width_dim
6738         \bool_set_true:N \l_@@_auto_columns_width_bool
6739     }
6740 }

6741 \NewDocumentEnvironment { NiceMatrixBlock } { ! O{ } }
6742 {
6743     \int_gincr:N \g_@@_NiceMatrixBlock_int
6744     \dim_zero:N \l_@@_columns_width_dim

```

```

6745 \keys_set:nn { NiceMatrix / NiceMatrixBlock } { #1 }
6746 \bool_if:NT \l_@@_block_auto_columns_width_bool
6747 {
6748   \cs_if_exist:cT
6749     { @@_max_cell_width_ \int_use:N \g_@@_NiceMatrixBlock_int }
6750   {
6751     % is \exp_args:NNe mandatory?
6752     \exp_args:NNe \dim_set:Nn \l_@@_columns_width_dim
6753     {
6754       \use:c
6755         { @@_max_cell_width_ \int_use:N \g_@@_NiceMatrixBlock_int }
6756     }
6757   }
6758 }
6759 }
```

At the end of the environment `{NiceMatrixBlock}`, we write in the main aux file instructions for the column width of all the environments of the block (that's why we have stored the number of the first environment of the block in the counter `\l_@@_first_env_block_int`).

```

6760 {
6761   \legacy_if:nTF { measuring@ }
```

If `{NiceMatrixBlock}` is used in an environment of `amsmath` such as `{align}`: cf. question 694957 on TeX StackExchange. The most important line in that case is the following one.

```

6762 { \int_gdecr:N \g_@@_NiceMatrixBlock_int }
6763 {
6764   \bool_if:NT \l_@@_block_auto_columns_width_bool
6765   {
6766     \iow_shipout:Nn \omainaux \ExplSyntaxOn
6767     \iow_shipout:Nx \omainaux
6768     {
6769       \cs_gset:cpn
6770         { @@ _ max _ cell _ width _ \int_use:N \g_@@_NiceMatrixBlock_int }
```

For technical reasons, we have to include the width of a potential rule on the right side of the cells.

```

6771   { \dim_eval:n { \g_@@_max_cell_width_dim + \arrayrulewidth } }
6772   }
6773   \iow_shipout:Nn \omainaux \ExplSyntaxOff
6774 }
6775 }
6776 \ignorespacesafterend
6777 }
```

26 The extra nodes

First, two variants of the functions `\dim_min:nn` and `\dim_max:nn`.

```

6778 \cs_generate_variant:Nn \dim_min:nn { v n }
6779 \cs_generate_variant:Nn \dim_max:nn { v n }
```

The following command is called in `\@@_use_arraybox_with_notes_c`: just before the construction of the blocks (if the creation of medium nodes is required, medium nodes are also created for the blocks and that construction uses the standard medium nodes).

```

6780 \cs_new_protected:Npn \@@_create_extra_nodes:
6781 {
6782   \bool_if:nTF \l_@@_medium_nodes_bool
6783   {
6784     \bool_if:NTF \l_@@_large_nodes_bool
6785       \@@_create_medium_and_large_nodes:
6786       \@@_create_medium_nodes:
6787   }
```

```

6788     { \bool_if:NT \l_@@_large_nodes_bool \@@_create_large_nodes: }
6789 }
```

We have three macros of creation of nodes: `\@@_create_medium_nodes:`, `\@@_create_large_nodes:` and `\@@_create_medium_and_large_nodes:`.

We have to compute the mathematical coordinates of the “medium nodes”. These mathematical coordinates are also used to compute the mathematical coordinates of the “large nodes”. That’s why we write a command `\@@_computations_for_medium_nodes:` to do these computations.

The command `\@@_computations_for_medium_nodes:` must be used in a `{pgfpicture}`.

For each row i , we compute two dimensions `l_@@_row_i_min_dim` and `l_@@_row_i_max_dim`. The dimension `l_@@_row_i_min_dim` is the minimal y -value of all the cells of the row i . The dimension `l_@@_row_i_max_dim` is the maximal y -value of all the cells of the row i .

Similarly, for each column j , we compute two dimensions `l_@@_column_j_min_dim` and `l_@@_column_j_max_dim`. The dimension `l_@@_column_j_min_dim` is the minimal x -value of all the cells of the column j . The dimension `l_@@_column_j_max_dim` is the maximal x -value of all the cells of the column j .

Since these dimensions will be computed as maximum or minimum, we initialize them to `\c_max_dim` or `-\c_max_dim`.

```

6790 \cs_new_protected:Npn \@@_computations_for_medium_nodes:
6791 {
6792     \int_step_variable:nnNn \l_@@_first_row_int \g_@@_row_total_int \@@_i:
6793     {
6794         \dim_zero_new:c { l_@@_row_\@@_i: _min_dim }
6795         \dim_set_eq:cN { l_@@_row_\@@_i: _min_dim } \c_max_dim
6796         \dim_zero_new:c { l_@@_row_\@@_i: _max_dim }
6797         \dim_set:cn { l_@@_row_\@@_i: _max_dim } { - \c_max_dim }
6798     }
6799     \int_step_variable:nnNn \l_@@_first_col_int \g_@@_col_total_int \@@_j:
6800     {
6801         \dim_zero_new:c { l_@@_column_\@@_j: _min_dim }
6802         \dim_set_eq:cN { l_@@_column_\@@_j: _min_dim } \c_max_dim
6803         \dim_zero_new:c { l_@@_column_\@@_j: _max_dim }
6804         \dim_set:cn { l_@@_column_\@@_j: _max_dim } { - \c_max_dim }
6805     }
}
```

We begin the two nested loops over the rows and the columns of the array.

```

6806 \int_step_variable:nnNn \l_@@_first_row_int \g_@@_row_total_int \@@_i:
6807 {
6808     \int_step_variable:nnNn
6809         \l_@@_first_col_int \g_@@_col_total_int \@@_j:
```

If the cell $(i-j)$ is empty or an implicit cell (that is to say a cell after implicit ampersands `&`) we don’t update the dimensions we want to compute.

```

6810 {
6811     \cs_if_exist:cT
6812         { pgf @ sh @ ns @ \@@_env: - \@@_i: - \@@_j: }
```

We retrieve the coordinates of the anchor `south west` of the (normal) node of the cell $(i-j)$. They will be stored in `\pgf@x` and `\pgf@y`.

```

6813 {
6814     \pgfpointanchor { \@@_env: - \@@_i: - \@@_j: } { south-west }
6815     \dim_set:cn { l_@@_row_\@@_i: _min_dim}
6816         { \dim_min:vn { l_@@_row_\@@_i: _min_dim } \pgf@y }
6817     \seq_if_in:NxF \g_@@_multicolumn_cells_seq { \@@_i: - \@@_j: }
6818     {
6819         \dim_set:cn { l_@@_column_\@@_j: _min_dim}
6820             { \dim_min:vn { l_@@_column_\@@_j: _min_dim } \pgf@x }
6821     }
```

We retrieve the coordinates of the anchor `north east` of the (normal) node of the cell $(i-j)$. They will be stored in `\pgf@x` and `\pgf@y`.

```

6822          \pgfpointanchor { \@@_env: - \@@_i: - \@@_j: } { north-east }
6823          \dim_set:cn { l_@@_row _ \@@_i: _ max_dim }
6824          { \dim_max:vn { l_@@_row _ \@@_i: _ max_dim } \pgf@y }
6825          \seq_if_in:NxF \g_@@_multicolumn_cells_seq { \@@_i: - \@@_j: }
6826          {
6827              \dim_set:cn { l_@@_column _ \@@_j: _ max_dim }
6828              { \dim_max:vn { l_@@_column _ \@@_j: _ max_dim } \pgf@x }
6829          }
6830      }
6831  }
6832 }
```

Now, we have to deal with empty rows or empty columns since we don't have created nodes in such rows and columns.

```

6833 \int_step_variable:nnNn \l_@@_first_row_int \g_@@_row_total_int \@@_i:
6834 {
6835     \dim_compare:nNnT
6836     { \dim_use:c { l_@@_row _ \@@_i: _ min _ dim } } = \c_max_dim
6837     {
6838         \@@_qpoint:n { row - \@@_i: - base }
6839         \dim_set:cn { l_@@_row _ \@@_i: _ max _ dim } \pgf@y
6840         \dim_set:cn { l_@@_row _ \@@_i: _ min _ dim } \pgf@y
6841     }
6842 }
6843 \int_step_variable:nnNn \l_@@_first_col_int \g_@@_col_total_int \@@_j:
6844 {
6845     \dim_compare:nNnT
6846     { \dim_use:c { l_@@_column _ \@@_j: _ min _ dim } } = \c_max_dim
6847     {
6848         \@@_qpoint:n { col - \@@_j: }
6849         \dim_set:cn { l_@@_column _ \@@_j: _ max _ dim } \pgf@y
6850         \dim_set:cn { l_@@_column _ \@@_j: _ min _ dim } \pgf@y
6851     }
6852 }
6853 }
```

Here is the command `\@@_create_medium_nodes:`. When this command is used, the “medium nodes” are created.

```

6854 \cs_new_protected:Npn \@@_create_medium_nodes:
6855 {
6856     \pgfpicture
6857     \pgfrememberpicturepositiononpagetrue
6858     \pgfrelevantforpicturesizefalse
6859     \@@_computations_for_medium_nodes:
```

Now, we can create the “medium nodes”. We use a command `\@@_create_nodes:` because this command will also be used for the creation of the “large nodes”.

```

6860 \cs_set_nopar:Npn \l_@@_suffix_tl { -medium }
6861 \@@_create_nodes:
6862 \endpgfpicture
6863 }
```

The command `\@@_create_large_nodes:` must be used when we want to create only the “large nodes” and not the medium ones¹⁴. However, the computation of the mathematical coordinates of the “large nodes” needs the computation of the mathematical coordinates of the “medium nodes”. Hence, we use first `\@@_computations_for_medium_nodes:` and then the command `\@@_computations_for_large_nodes:`.

¹⁴If we want to create both, we have to use `\@@_create_medium_and_large_nodes:`

```

6864 \cs_new_protected:Npn \@@_create_large_nodes:
6865 {
6866   \pgfpicture
6867     \pgfrememberpicturepositiononpagetrue
6868     \pgf@relevantforpicturesizefalse
6869     \@@_computations_for_medium_nodes:
6870     \@@_computations_for_large_nodes:
6871     \cs_set_nopar:Npn \l_@@_suffix_tl { - large }
6872     \@@_create_nodes:
6873   \endpgfpicture
6874 }
6875 \cs_new_protected:Npn \@@_create_medium_and_large_nodes:
6876 {
6877   \pgfpicture
6878     \pgfrememberpicturepositiononpagetrue
6879     \pgf@relevantforpicturesizefalse
6880     \@@_computations_for_medium_nodes:

```

Now, we can create the “medium nodes”. We use a command `\@@_create_nodes:` because this command will also be used for the creation of the “large nodes”.

```

6881 \cs_set_nopar:Npn \l_@@_suffix_tl { - medium }
6882 \@@_create_nodes:
6883 \@@_computations_for_large_nodes:
6884 \cs_set_nopar:Npn \l_@@_suffix_tl { - large }
6885 \@@_create_nodes:
6886 \endpgfpicture
6887 }

```

For “large nodes”, the exterior rows and columns don’t interfer. That’s why the loop over the columns will start at 1 and stop at `\c@jCol` (and not `\g_@@_col_total_int`). Idem for the rows.

```

6888 \cs_new_protected:Npn \@@_computations_for_large_nodes:
6889 {
6890   \int_set_eq:NN \l_@@_first_row_int \c_one_int
6891   \int_set_eq:NN \l_@@_first_col_int \c_one_int

```

We have to change the values of all the dimensions `\l_@@_row_i_min_dim`, `\l_@@_row_i_max_dim`, `\l_@@_column_j_min_dim` and `\l_@@_column_j_max_dim`.

```

6892   \int_step_variable:nNn { \c@iRow - 1 } \@@_i:
6893   {
6894     \dim_set:cn { \l_@@_row_ \@@_i: _ min _ dim } {
6895       (
6896         \dim_use:c { \l_@@_row_ \@@_i: _ min _ dim } +
6897         \dim_use:c { \l_@@_row_ \int_eval:n { \@@_i: + 1 } _ max _ dim }
6898       )
6899       / 2
6900     }
6901   }
6902   \dim_set_eq:cc { \l_@@_row_ \int_eval:n { \@@_i: + 1 } _ max _ dim }
6903   { \l_@@_row_ \@@_i: _ min _ dim }
6904 }
6905 \int_step_variable:nNn { \c@jCol - 1 } \@@_j:
6906 {
6907   \dim_set:cn { \l_@@_column_ \@@_j: _ max _ dim } {
6908     (
6909       (
6910         \dim_use:c { \l_@@_column_ \@@_j: _ max _ dim } +
6911         \dim_use:c { \l_@@_column_ \int_eval:n { \@@_j: + 1 } _ min _ dim }
6912       )
6913       / 2
6914     }
6915   }
6916   \dim_set_eq:cc { \l_@@_column_ \int_eval:n { \@@_j: + 1 } _ min _ dim }
6917   { \l_@@_column_ \@@_j: _ max _ dim }
6918 }

```

Here, we have to use `\dim_sub:cn` because of the number 1 in the name.

```

6919   \dim_sub:cn
6920     { l_@@_column _ 1 _ min _ dim }
6921     \l_@@_left_margin_dim
6922   \dim_add:cn
6923     { l_@@_column _ \int_use:N \c@jCol _ max _ dim }
6924     \l_@@_right_margin_dim
6925 }
```

The command `\@@_create_nodes:` is used twice: for the construction of the “medium nodes” and for the construction of the “large nodes”. The nodes are constructed with the value of all the dimensions `l_@@_row_i_min_dim`, `l_@@_row_i_max_dim`, `l_@@_column_j_min_dim` and `l_@@_column_j_max_dim`. Between the construction of the “medium nodes” and the “large nodes”, the values of these dimensions are changed.

The function also uses `\l_@@_suffix_tl` (-medium or -large).

```

6926 \cs_new_protected:Npn \@@_create_nodes:
6927 {
6928   \int_step_variable:nnNn \l_@@_first_row_int \g_@@_row_total_int \@@_i:
6929   {
6930     \int_step_variable:nnNn \l_@@_first_col_int \g_@@_col_total_int \@@_j:
6931     {

```

We draw the rectangular node for the cell (`\@@_i-\@@_j`).

```

6932 \@@_pgf_rect_node:nnnn
6933   { \@@_env: - \@@_i: - \@@_j: \l_@@_suffix_tl }
6934   { \dim_use:c { l_@@_column_ \@@_j: _min_dim } }
6935   { \dim_use:c { l_@@_row_ \@@_i: _min_dim } }
6936   { \dim_use:c { l_@@_column_ \@@_j: _max_dim } }
6937   { \dim_use:c { l_@@_row_ \@@_i: _max_dim } }
6938 \str_if_empty:NF \l_@@_name_str
6939   {
6940     \pgfnodealias
6941       { \l_@@_name_str - \@@_i: - \@@_j: \l_@@_suffix_tl }
6942       { \@@_env: - \@@_i: - \@@_j: \l_@@_suffix_tl }
6943   }
6944 }
6945 }
```

Now, we create the nodes for the cells of the `\multicolumn`. We recall that we have stored in `\g_@@_multicolumn_cells_seq` the list of the cells where a `\multicolumn{n}{...}{...}` with $n > 1$ was issued and in `\g_@@_multicolumn_sizes_seq` the correspondant values of n .

```

6946   \seq_map_pairwise_function:NNN
6947   \g_@@_multicolumn_cells_seq
6948   \g_@@_multicolumn_sizes_seq
6949   \@@_node_for_multicolumn:nn
6950 }

6951 \cs_new_protected:Npn \@@_extract_coords_values: #1 - #2 \q_stop
6952 {
6953   \cs_set_nopar:Npn \@@_i: { #1 }
6954   \cs_set_nopar:Npn \@@_j: { #2 }
6955 }
```

The command `\@@_node_for_multicolumn:nn` takes two arguments. The first is the position of the cell where the command `\multicolumn{n}{...}{...}` was issued in the format $i-j$ and the second is the value of n (the length of the “multi-cell”).

```

6956 \cs_new_protected:Npn \@@_node_for_multicolumn:nn #1 #2
6957 {
6958   \@@_extract_coords_values: #1 \q_stop
6959   \@@_pgf_rect_node:nnnn
6960   { \@@_env: - \@@_i: - \@@_j: \l_@@_suffix_tl }
6961   { \dim_use:c { l_@@_column_ \@@_j: _min _ dim } }
```

```

6962 { \dim_use:c { l_@@_row _ \@@_i: _ min _ dim } }
6963 { \dim_use:c { l_@@_column _ \int_eval:n { \@@_j: +#2-1 } _ max _ dim } }
6964 { \dim_use:c { l_@@_row _ \@@_i: _ max _ dim } }
6965 \str_if_empty:NF \l_@@_name_str
6966 {
6967     \pgfnodealias
6968         { \l_@@_name_str - \@@_i: - \@@_j: \l_@@_suffix_tl }
6969         { \int_use:N \g_@@_env_int - \@@_i: - \@@_j: \l_@@_suffix_tl}
6970 }
6971 }

```

27 The blocks

The code deals with the command `\Block`. This command has no direct link with the environment `{NiceMatrixBlock}`.

The options of the command `\Block` will be analyzed first in the cell of the array (and once again when the block will be put in the array). Here is the set of keys for the first pass.

```

6972 \keys_define:nn { NiceMatrix / Block / FirstPass }
6973 {
6974     l .code:n = \str_set:Nn \l_@@_hpos_block_str l ,
6975     l .value_forbidden:n = true ,
6976     r .code:n = \str_set:Nn \l_@@_hpos_block_str r ,
6977     r .value_forbidden:n = true ,
6978     c .code:n = \str_set:Nn \l_@@_hpos_block_str c ,
6979     c .value_forbidden:n = true ,
6980     L .code:n = \str_set:Nn \l_@@_hpos_block_str l ,
6981     L .value_forbidden:n = true ,
6982     R .code:n = \str_set:Nn \l_@@_hpos_block_str r ,
6983     R .value_forbidden:n = true ,
6984     C .code:n = \str_set:Nn \l_@@_hpos_block_str c ,
6985     C .value_forbidden:n = true ,
6986     t .code:n = \str_set:Nn \l_@@_vpos_block_str t ,
6987     t .value_forbidden:n = true ,
6988     T .code:n = \str_set:Nn \l_@@_vpos_block_str T ,
6989     T .value_forbidden:n = true ,
6990     b .code:n = \str_set:Nn \l_@@_vpos_block_str b ,
6991     b .value_forbidden:n = true ,
6992     B .code:n = \str_set:Nn \l_@@_vpos_block_str B ,
6993     B .value_forbidden:n = true ,
6994     color .code:n =
6995         \@@_color:n { #1 }
6996     \tl_set_rescan:Nnn
6997         \l_@@_draw_tl
6998         { \char_set_catcode_other:N ! }
6999         { #1 } ,
7000     color .value_required:n = true ,
7001     respect_arraystretch .code:n =
7002         \cs_set_eq:NN \@@_reset_arraystretch: \prg_do_nothing: ,
7003     respect_arraystretch .value_forbidden:n = true ,
7004 }

```

The following command `\@@_Block:` will be linked to `\Block` in the environments of `nicematrix`. We define it with `\NewExpandableDocumentCommand` because it has an optional argument between `<` and `>`. It's mandatory to use an expandable command.

```

7005 \cs_new_protected:Npn \@@_Block: { \@@_collect_options:n { \@@_Block_i: } }
7006 \NewExpandableDocumentCommand \@@_Block_i: { m m D < > { } +m }
7007 {

```

If the first mandatory argument of the command (which is the size of the block with the syntax $i-j$) has not been provided by the user, you use 1-1 (that is to say a block of only one cell).

```

7008 \peek_remove_spaces:n
7009 {
710  \tl_if_blank:nTF { #2 }
711  {
712    \c_@_Block_ii:nnnn \c_one_int \c_one_int
713    {
714      \int_compare:nNnTF { \char_value_catcode:n { 45 } } = { 13 }
715      \c_@_Block_i_czech \c_@_Block_i
716      #2 \q_stop
717    }
718    { #1 } { #3 } { #4 }
719  }
720 }
```

With the following construction, we extract the values of i and j in the first mandatory argument of the command.

```
720 \cs_new:Npn \c_@_Block_i #1-#2 \q_stop { \c_@_Block_ii:nnnn { #1 } { #2 } }
```

With babel with the key `czech`, the character `-` (hyphen) is active. That's why we need a special version. Remark that we could not use a preprocessor in the command `\c_@_Block:` to do the job because the command `\c_@_Block:` is defined with the command `\NewExpandableDocumentCommand`.

```

721 {
722  \char_set_catcode_active:N -
723  \cs_new:Npn \c_@_Block_i_czech #1-#2 \q_stop { \c_@_Block_ii:nnnn { #1 } { #2 } }
724 }
```

Now, the arguments have been extracted: `#1` is i (the number of rows of the block), `#2` is j (the number of columns of the block), `#3` is the list of `key=values` pairs, `#4` are the tokens to put before the math mode and before the composition of the block and `#5` is the label (=content) of the block.

```

725 \cs_new_protected:Npn \c_@_Block_ii:nnnn #1 #2 #3 #4 #5
726 {
```

We recall that `#1` and `#2` have been extracted from the first mandatory argument of `\Block` (which is of the syntax $i-j$). However, the user is allowed to omit i or j (or both). We detect that situation by replacing a missing value by 100 (it's a convention: when the block will actually be drawn these values will be detected and interpreted as *maximal possible value* according to the actual size of the array).

```

727 \bool_lazy_or:nnTF
728  {
729    \tl_if_blank_p:n { #1 } }
730  {
731    \str_if_eq_p:nn { #1 } { * } }
732  {
733    \int_set:Nn \l_tmpa_int { 100 } }
734  {
735    \int_set:Nn \l_tmpa_int { #1 } }
736 \bool_lazy_or:nnTF
737  {
738    \tl_if_blank_p:n { #2 } }
739  {
740    \str_if_eq_p:nn { #2 } { * } }
741  {
742    \int_set:Nn \l_tmpb_int { 100 } }
743  {
744    \int_set:Nn \l_tmpb_int { #2 } }
```

If the block is mono-column.

```

737 \int_compare:nNnTF \l_tmpb_int = \c_one_int
738 {
739  \tl_if_empty:NTF \l_@@_hpos_cell_tl
740  {
741    \str_set_eq:NN \l_@@_hpos_block_str \c_@@_c_str }
742  {
743    \str_set:NV \l_@@_hpos_block_str \l_@@_hpos_cell_tl }
744 }
```

The value of `\l_@@_hpos_block_str` may be modified by the keys of the command `\Block` that we will analyze now.

```
744 \keys_set_known:nn { NiceMatrix / Block / FirstPass } { #3 }
```

```

7045 \tl_set:Nx \l_tmpa_tl
7046 {
7047   { \int_use:N \c@iRow }
7048   { \int_use:N \c@jCol }
7049   { \int_eval:n { \c@iRow + \l_tmpa_int - 1 } }
7050   { \int_eval:n { \c@jCol + \l_tmpb_int - 1 } }
7051 }

```

Now, `\l_tmpa_tl` contains an “object” corresponding to the position of the block with four components, each of them surrounded by curly brackets:
`{imin}{jmin}{imax}{jmax}`.

If the block is mono-column or mono-row, we have a special treatment. That’s why we have two macros: `\@@_Block_iv:nnnnn` and `\@@_Block_v:nnnnn` (the five arguments of those macros are provided by curryfication).

```

7052 \bool_if:nTF
7053 {
7054   (
7055     \int_compare_p:nNn \l_tmpa_int = \c_one_int
7056     ||
7057     \int_compare_p:nNn \l_tmpb_int = \c_one_int
7058   )
7059   && ! \tl_if_empty_p:n { #5 }

```

For the blocks mono-column, we will compose right now in a box in order to compute its width and take that width into account for the width of the column. However, if the column is a `X` column, we should not do that since the width is determined by another way. This should be the same for the `p`, `m` and `b` columns and we should modify that point. However, for the `X` column, it’s imperative. Otherwise, the process for the determination of the widths of the columns will be wrong.

```

7060   && ! \l_@@_X_bool
7061 }
7062 { \exp_args:Nee \@@_Block_iv:nnnnn }
7063 { \exp_args:Nee \@@_Block_v:nnnnn }
7064 { \l_tmpa_int } { \l_tmpb_int } { #3 } { #4 } { #5 }
7065 }

```

The following macro is for the case of a `\Block` which is mono-row or mono-column (or both). In that case, the content of the block is composed right now in a box (because we have to take into account the dimensions of that box for the width of the current column or the height and the depth of the current row). However, that box will be put in the array *after the construction of the array* (by using PGF) with `\@@_draw_blocks:` and above all `\@@_Block_v:nnnnnn` which will do the main job.

#1 is i (the number of rows of the block), #2 is j (the number of columns of the block), #3 is the list of `key=values` pairs, #4 are the tokens to put before the potential math mode and before the composition of the block and #5 is the label (=content) of the block.

```

7066 \cs_new_protected:Npn \@@_Block_iv:nnnnn #1 #2 #3 #4 #5
7067 {
7068   \int_gincr:N \g_@@_block_box_int
7069   \cs_set_protected_nopar:Npn \diagbox ##1 ##2
7070   {
7071     \tl_gput_right:Nx \g_@@_pre_code_after_tl
7072     {
7073       \@@_actually_diagbox:nnnnnn
7074       { \int_use:N \c@iRow }
7075       { \int_use:N \c@jCol }
7076       { \int_eval:n { \c@iRow + #1 - 1 } }
7077       { \int_eval:n { \c@jCol + #2 - 1 } }
7078       { \g_@@_row_style_tl \exp_not:n { ##1 } }
7079       { \g_@@_row_style_tl \exp_not:n { ##2 } }
7080     }
7081   }
7082   \box_gclear_new:c
7083   { g_@@_block _ box _ \int_use:N \g_@@_block_box_int _ box }

```

Now, we will actually compose the content of the `\Block` in a TeX box. *Be careful:* if after the construction of the box, the boolean `\g_@@_rotate_bool` is raised (which means that the command `\rotate` was present in the content of the `\Block`) we will rotate the box but also, maybe, change the position of the baseline!

```
7084     \hbox_gset:cn
7085     { g_@@_block _ box _ \int_use:N \g_@@_block_box_int _ box }
7086     {
```

For a mono-column block, if the user has specified a color for the column in the preamble of the array, we want to fix that color in the box we construct. We do that with `\set@color` and not `\color_ensure_current:` (in order to use `\color_ensure_current:` safely, you should load l3backend before the `\documentclass` with `\RequirePackage{expl3}`).

```
7087     \tl_if_empty:NTF \l_@@_color_tl
7088     { \int_compare:nNnT { #2 } = \c_one_int \set@color }
7089     { \c@color:o \l_@@_color_tl }
```

If the block is mono-row, we use `\g_@@_row_style_tl` even if it has yet been used in the beginning of the cell where the command `\Block` has been issued because we want to be able to take into account a potential instruction of color of the font in `\g_@@_row_style_tl`.

```
7090     \int_compare:nNnT { #1 } = \c_one_int
7091     {
7092         \int_if_zero:nTF \c@iRow
7093             \l_@@_code_for_first_row_tl
7094             {
7095                 \int_compare:nNnT \c@iRow = \l_@@_last_row_int
7096                     \l_@@_code_for_last_row_tl
7097             }
7098             \g_@@_row_style_tl
7099     }
```

The following command will be no-op when `respect-arraystretch` is in force.

```
7100     \c@_reset_arraystretch:
7101     \dim_zero:N \extrarowheight
```

`#4` is the optional argument of the command `\Block`, provided with the syntax `<...>`.

```
7102     #4
```

We adjust `\l_@@_hpos_block_str` when `\rotate` has been used (in the cell where the command `\Block` is used but maybe in `#4`, `\RowStyle`, `code-for-first-row`, etc.).

```
7103     \c@_adjust_hpos_rotate:
```

The boolean `\g_@@_rotate_bool` will be also considered *after the composition of the box* (in order to rotate the box).

Remind that we are in the command of composition of the box of the block. Previously, we have only done some tuning. Now, we will actually compose the content with a `{tabular}`, an `{array}` or a `{minipage}`.

```
7104     \bool_if:NTF \l_@@_tabular_bool
7105     {
7106         \bool_lazy_all:nTF
7107         {
7108             { \int_compare_p:nNn { #2 } = \c_one_int }
```

Remind that, when the column has not a fixed width, the dimension `\l_@@_col_width_dim` has the conventional value of `-1 cm`.

```
7109             { ! \dim_compare_p:nNn \l_@@_col_width_dim < \c_zero_dim }
7110             { ! \g_@@_rotate_bool }
7111         }
```

When the block is mono-column in a column with a fixed width (eg `p{3cm}`), we use a `{minipage}`.

```
7112     {
7113         \use:e
7114         {
7115             \exp_not:N \begin { minipage }%
7116                 [ \str_lowercase:V \l_@@_vpos_block_str ]
7117                 { \l_@@_col_width_dim }
```

```

7118     \str_case:on \l_@@_hpos_block_str
7119         { c \centering r \raggedleft l \raggedright }
7120     }
7121     #5
7122     \end{minipage}
7123 }

```

In the other cases, we use a `{tabular}`.

```

7124 {
7125     \use:e
7126     {
7127         \exp_not:N \begin{tabular}%
7128             [ \str_lowercase:V \l_@@_vpos_block_str ]
7129             { @ { } \l_@@_hpos_block_str @ { } }
7130         }
7131         #5
7132     \end{tabular}
7133 }
7134 }

```

If we are in a mathematical array (`\l_@@_tabular_bool` is `false`). The composition is always done with an `{array}` (never with a `{minipage}`).

```

7135 {
7136     \c_math_toggle_token
7137     \use:e
7138     {
7139         \exp_not:N \begin{array}%
7140             [ \str_lowercase:V \l_@@_vpos_block_str ]
7141             { @ { } \l_@@_hpos_block_str @ { } }
7142         }
7143         #5
7144     \end{array}
7145     \c_math_toggle_token
7146 }
7147 }

```

The box which will contain the content of the block has now been composed.

If there were `\rotate` (which raises `\g_@@_rotate_bool`) in the content of the `\Block`, we do a rotation of the box (and we also adjust the baseline the rotated box).

```
7148 \bool_if:NT \g_@@_rotate_bool \g_@@_rotate_box_of_block:
```

If we are in a mono-column block, we take into account the width of that block for the width of the column.

```

7149 \int_compare:nNnT { #2 } = \c_one_int
7150 {
7151     \dim_gset:Nn \g_@@_blocks_wd_dim
7152     {
7153         \dim_max:nn
7154             \g_@@_blocks_wd_dim
7155         {
7156             \box_wd:c
7157                 { g_@@_block _ box _ \int_use:N \g_@@_block_box_int _ box }
7158         }
7159     }
7160 }

```

If we are in a mono-row block and if that block has no vertical option for the position¹⁵, we take into account the height and the depth of that block for the height and the depth of the row.

```
7161 \str_if_eq:VnT \l_@@_vpos_block_str { c }
```

¹⁵If the block has a key of a vertical position, that means that it has to be put in a vertical space determined by the *others* cells of the row. Therefore there is no point creating space here. Moreover, that would lead to problems when a multi-row block with a position key such as `b` or `B`.

```

7162 {
7163   \int_compare:nNnT { #1 } = \c_one_int
7164   {
7165     \dim_gset:Nn \g_@@_blocks_ht_dim
7166     {
7167       \dim_max:nn
7168         \g_@@_blocks_ht_dim
7169       {
7170         \box_ht:c
7171           { g_@@_block _ box _ \int_use:N \g_@@_block_box_int _ box }
7172       }
7173     }
7174   \dim_gset:Nn \g_@@_blocks_dp_dim
7175   {
7176     \dim_max:nn
7177       \g_@@_blocks_dp_dim
7178     {
7179       \box_dp:c
7180         { g_@@_block _ box _ \int_use:N \g_@@_block_box_int _ box }
7181     }
7182   }
7183 }
7184 \seq_gput_right:Nx \g_@@_blocks_seq
7185 {
7186   \l_tmpa_tl

```

In the list of options #3, maybe there is a key for the horizontal alignment (`l`, `r` or `c`). In that case, that key has been read and stored in `\l_@@_hpos_block_str`. However, maybe there were no key of the horizontal alignment and that's why we put a key corresponding to the value of `\l_@@_hpos_block_str`, which is fixed by the type of current column.

```

7188 {
7189   \exp_not:n { #3 } ,
7190   \l_@@_hpos_block_str ,

```

Now, we put a key for the vertical alignment.

```

7191 \bool_if:NT \g_@@_rotate_bool
7192 {
7193   \bool_if:NTF \g_@@_rotate_c_bool
7194   {

7251 }
```

The following macro is for the standard case, where the block is not mono-row and not mono-column. In that case, the content of the block is *not* composed right now in a box. The composition in a box will be done further, just after the construction of the array (cf. `\g@_draw_blocks:` and above all `\g@_Block_v:nnnnn`).

#1 is *i* (the number of rows of the block), #2 is *j* (the number of columns of the block), #3 is the list of *key=values* pairs, #4 are the tokens to put before the math mode and before the composition of the block and #5 is the label (=content) of the block.

```

```

The integer \l_@@_last_row_int will be the last row of the block and \l_@@_last_col_int its last column.

```

7370   \int_zero_new:N \l_@@_last_row_int
7371   \int_zero_new:N \l_@@_last_col_int

```

We remind that the first mandatory argument of the command `\Block` is the size of the block with the special format $i-j$. However, the user is allowed to omit i or j (or both). This will be interpreted as: the last row (resp. column) of the block will be the last row (resp. column) of the block (without the potential exterior row—resp. column—of the array). By convention, this is stored in `\g_@@_blocks_seq` as a number of rows (resp. columns) for the block equal to 100. That's what we detect now.

```

Let's consider the following `\begin{NiceTabular}{cc!{\hspace{1cm}}c}`. Because of the instruction `!{\hspace{1cm}}` in the preamble which increases the space between the columns (by adding, in fact, that space to the previous column, that is to say the second column of the tabular), we will create *two* nodes relative to the block: the node `1-1-block` and the node `1-1-block-short`.

```

\begin{NiceTabular}{cc!{\hspace{1cm}}c}
\Block{2-2}{our block} & one & \\
& two & \\
three & four & five \\
six & seven & eight \\
\end{NiceTabular}

```

We highlight the node `1-1-block`

our block	one
two	
three	four
six	seven

We highlight the node `1-1-block-short`

our block	one
two	
three	four
six	seven

The construction of the node corresponding to the merged cells.

```

7514 \pgfpicture
7515   \pgfrememberpicturepositiononpagetrue
7516   \pgf@relevantforpicturesizefalse
7517   \@@_qpoint:n { row - #1 }
7518   \dim_set_eq:NN \l_tmpa_dim \pgf@y
7519   \@@_qpoint:n { col - #2 }
7520   \dim_set_eq:NN \l_tmpb_dim \pgf@x
7521   \@@_qpoint:n { row - \int_eval:n { \l_@@_last_row_int + 1 } }
7522   \dim_set_eq:NN \l_@@_tmpc_dim \pgf@y
7523   \@@_qpoint:n { col - \int_eval:n { \l_@@_last_col_int + 1 } }
7524   \dim_set_eq:NN \l_@@_tmpd_dim \pgf@x

```

We construct the node for the block with the name (#1-#2-block).

The function `\@@_pgf_rect_node:nnnnn` takes in as arguments the name of the node and the four coordinates of two opposite corner points of the rectangle.

```

7525 \@@_pgf_rect_node:nnnnn
7526   { \@@_env: - #1 - #2 - block }
7527   \l_tmpb_dim \l_tmpa_dim \l_@@_tmpd_dim \l_@@_tmpc_dim
7528   \str_if_empty:NF \l_@@_block_name_str
7529   {
7530     \pgfnodealias
7531       { \@@_env: - \l_@@_block_name_str }
7532       { \@@_env: - #1 - #2 - block }
7533     \str_if_empty:NF \l_@@_name_str
7534     {
7535       \pgfnodealias
7536         { \l_@@_name_str - \l_@@_block_name_str }
7537         { \@@_env: - #1 - #2 - block }
7538     }
7539   }

```

Now, we create the “short node” which, in general, will be used to put the label (that is to say the content of the node). However, if one the keys L, C or R is used (that information is provided by the boolean `\l_@@_hpos_of_block_cap_bool`), we don’t need to create that node since the normal node is used to put the label.

```

7540 \bool_if:NF \l_@@_hpos_of_block_cap_bool
7541   {
7542     \dim_set_eq:NN \l_tmpb_dim \c_max_dim

```

The short node is constructed by taking into account the *contents* of the columns involved in at least one cell of the block. That’s why we have to do a loop over the rows of the array.

```

7543 \int_step_inline:nnn \l_@@_first_row_int \g_@@_row_total_int
7544   {

```

We recall that, when a cell is empty, no (normal) node is created in that cell. That’s why we test the existence of the node before using it.

```

7545 \cs_if_exist:cT
7546   { pgf @ sh @ ns @ \@@_env: - ##1 - #2 }
7547   {
7548     \seq_if_in:NnF \g_@@_multicolumn_cells_seq { ##1 - #2 }
7549     {
7550       \pgfpointanchor { \@@_env: - ##1 - #2 } { west }
7551       \dim_set:Nn \l_tmpb_dim { \dim_min:nn \l_tmpb_dim \pgf@x }
7552     }
7553   }
7554 }

```

If all the cells of the column were empty, `\l_tmpb_dim` has still the same value `\c_max_dim`. In that case, you use for `\l_tmpb_dim` the value of the position of the vertical rule.

```

7555 \dim_compare:nNnT \l_tmpb_dim = \c_max_dim
7556   {
7557     \@@_qpoint:n { col - #2 }
7558     \dim_set_eq:NN \l_tmpb_dim \pgf@x
7559   }

```

```

7560 \dim_set:Nn \l_@@_tmpd_dim { - \c_max_dim }
7561 \int_step_inline:nnn \l_@@_first_row_int \g_@@_row_total_int
7562 {
7563   \cs_if_exist:cT
7564     { pgf @ sh @ ns @ \@@_env: - ##1 - \int_use:N \l_@@_last_col_int }
7565   {
7566     \seq_if_in:NnF \g_@@_multicolumn_cells_seq { ##1 - #2 }
7567   {
7568     \pgfpointanchor
7569       { \@@_env: - ##1 - \int_use:N \l_@@_last_col_int }
7570       { east }
7571     \dim_set:Nn \l_@@_tmpd_dim { \dim_max:nn \l_@@_tmpd_dim \pgf@x }
7572   }
7573 }
7574 }
7575 \dim_compare:nNnT \l_@@_tmpd_dim = { - \c_max_dim }
7576 {
7577   \@@_qpoint:n { col - \int_eval:n { \l_@@_last_col_int + 1 } }
7578   \dim_set_eq:NN \l_@@_tmpd_dim \pgf@x
7579 }
7580 \@@_pgf_rect_node:nnnn
7581   { \@@_env: - #1 - #2 - block - short }
7582   \l_tmpb_dim \l_tmpa_dim \l_@@_tmpd_dim \l_@@_tmpc_dim
7583 }

```

If the creation of the “medium nodes” is required, we create a “medium node” for the block. The function `\@@_pgf_rect_node:nnn` takes in as arguments the name of the node and two PGF points.

```

7584 \bool_if:NT \l_@@_medium_nodes_bool
7585 {
7586   \@@_pgf_rect_node:nnn
7587   { \@@_env: - #1 - #2 - block - medium }
7588   { \pgfpointanchor { \@@_env: - #1 - #2 - medium } { north-west } }
7589   {
7590     \pgfpointanchor
7591       { \@@_env:
7592         - \int_use:N \l_@@_last_row_int
7593         - \int_use:N \l_@@_last_col_int - medium
7594       }
7595     { south-east }
7596   }
7597 }

```

Now, we will put the label of the block.

```

7598 \bool_lazy_any:nTF
7599 {
7600   { \str_if_eq_p:on \l_@@_vpos_block_str { c } }
7601   { \str_if_eq_p:on \l_@@_vpos_block_str { T } }
7602   { \str_if_eq_p:on \l_@@_vpos_block_str { B } }
7603 }
7604 {

```

If we are in the first column, we must put the block as if it was with the key `r`.

```
7605 \int_if_zero:nT { #2 } { \str_set_eq:NN \l_@@_hpos_block_str \c_@@_r_str }
```

If we are in the last column, we must put the block as if it was with the key `l`.

```

7606 \bool_if:nT \g_@@_last_col_found_bool
7607 {
7608   \int_compare:nNnT { #2 } = \g_@@_col_total_int
7609   { \str_set_eq:NN \l_@@_hpos_block_str \c_@@_l_str }
7610 }
```

\l_tmpa_t1 will contain the anchor of the PGF node which will be used.

```

7611   \tl_set:Nx \l_tmpa_t1

7911     rounded-corners .default:n = 4 pt ,
7912     line-width .dim_set:N = \l_@@_line_width_dim
7913 }

```

The following command will be used if the key `tikz` has been used for the command `\Block`. The arguments `#1` and `#2` are the coordinates of the first cell and `#3` and `#4` the coordinates of the last cell of the block. `#5` is a comma-separated list of the Tikz keys used with the path. However, among those keys, you have added in `nicematrix` a special key `offset` (an offset for the rectangle of the block). That's why we have to extract that key first.

```

8024 \@@_define_com:nnn v | |
8025 \@@_define_com:nnn V \| \|
8026 \@@_define_com:nnn B \{ \}

```

We define also a command `\AutoNiceMatrix` similar to the environment `{NiceMatrix}`.

```

8025 \NewDocumentCommand \AutoNiceMatrix { O { } m O { } m ! O { } }
8026 {
8027     \group_begin:
8028     \bool_gset_false:N \g_@@_delims_bool
8029     \AutoNiceMatrixWithDelims . . { #2 } { #4 } [ #1 , #3 , #5 ]
8030     \group_end:
8031 }

```

30 The redefinition of the command `\dotfill`

```

8032 \cs_set_eq:NN \@@_old_dotfill \dotfill
8033 \cs_new_protected:Npn \@@_dotfill:
8034 {

```

First, we insert `\@@_dotfill` (which is the saved version of `\dotfill`) in case of use of `\dotfill` “internally” in the cell (e.g. `\hbox to 1cm {\dotfill}`).

```

8035     \@@_old_dotfill
8036     \tl_gput_right:Nn \g_@@_cell_after_hook_tl \@@_dotfill_i:
8037 }

```

Now, if the box if not empty (unfortunately, we can't actually test whether the box is empty and that's why we only consider it's width), we insert `\@@_dotfill` (which is the saved version of `\dotfill`) in the cell of the array, and it will extend, since it is no longer in `\l_@@_cell_box`.

```

8038 \cs_new_protected:Npn \@@_dotfill_i:
8039   { \dim_compare:nNnT { \box_wd:N \l_@@_cell_box } = \c_zero_dim \@@_old_dotfill }

```

31 The command \diagbox

The command `\diagbox` will be linked to `\diagbox:nn` in the environments of `nicematrix`. However, there are also redefinitions of `\diagbox` in other circumstances.

```

8040 \cs_new_protected:Npn \@@_diagbox:nn #1 #2
8041   {
8042     \tl_gput_right:Nx \g_@@_pre_code_after_tl
8043     {
8044       \@@_actually_diagbox:nnnnnn
8045       { \int_use:N \c@iRow }
8046       { \int_use:N \c@jCol }
8047       { \int_use:N \c@iRow }
8048       { \int_use:N \c@jCol }

```

`\g_@@_row_style_tl` contains several instructions of the form:

```
\@@_if_row_less_than:nn { number } { instructions }
```

The command `\@@_if_row_less:nn` is fully expandable and, thus, the instructions will be inserted in the `\g_@@_pre_code_after_tl` only if `\diagbox` is used in a row which is the scope of that chunk of instructions.

```

8049   { \g_@@_row_style_tl \exp_not:n { #1 } }
8050   { \g_@@_row_style_tl \exp_not:n { #2 } }
8051 }

```

We put the cell with `\diagbox` in the sequence `\g_@@_pos_of_blocks_seq` because a cell with `\diagbox` must be considered as non empty by the key `corners`.

```

8052 \seq_gput_right:Nx \g_@@_pos_of_blocks_seq
8053   {
8054     { \int_use:N \c@iRow }
8055     { \int_use:N \c@jCol }
8056     { \int_use:N \c@iRow }
8057     { \int_use:N \c@jCol }

```

The last argument is for the name of the block.

```

8058   { }
8059 }
8060 }

```

The command `\diagbox` is also redefined locally when we draw a block.

The first four arguments of `\@@_actually_diagbox:nnnnnn` correspond to the rectangle (=block) to slash (we recall that it's possible to use `\diagbox` in a `\Block`). The other two are the elements to draw below and above the diagonal line.

```

8100 }
8101 {
8102 }
8103 \endpgfpicture
8104 }
```

32 The keyword `\CodeAfter`

In fact, in this subsection, we define the user command `\CodeAfter` for the case of the “normal syntax”. For the case of “light-syntax”, see the definition of the environment `{@@-light-syntax}` on p. 82.

In the environments of `nicematrix`, `\CodeAfter` will be linked to `\@@_CodeAfter::`. That macro must *not* be protected since it begins with `\omit`.

```
8105 \cs_new:Npn \@@_CodeAfter: { \omit \@@_CodeAfter_ii:n }
```

However, in each cell of the environment, the command `\CodeAfter` will be linked to the following command `\@@_CodeAfter_ii:n` which begins with `\backslash\backslash`.

```
8106 \cs_new_protected:Npn \@@_CodeAfter_i: { \\ \omit \@@_CodeAfter_ii:n }
```

We have to catch everything until the end of the current environment (of `nicematrix`). First, we go until the next command `\end`.

```

8107 \cs_new_protected:Npn \@@_CodeAfter_ii:n #1 \end
8108 {
8109   \tl_gput_right:Nn \g_nicematrix_code_after_tl { #1 }
8110   \@@_CodeAfter_iv:n
8111 }
```

We catch the argument of the command `\end` (in `#1`).

```

8112 \cs_new_protected:Npn \@@_CodeAfter_iv:n #1
8113 {
```

If this is really the `\end` of the current environment (of `nicematrix`), we put back the command `\end` and its argument in the TeX flow.

```
8114 \str_if_eq:eeTF \currenvir { #1 }
8115   { \end { #1 } }
```

If this is not the `\end` we are looking for, we put those tokens in `\g_nicematrix_code_after_tl` and we go on searching for the next command `\end` with a recursive call to the command `\@@_CodeAfter:n`.

```
8116 {
8117   \tl_gput_right:Nn \g_nicematrix_code_after_tl { \end { #1 } }
8118   \@@_CodeAfter_i:n
8119 }
8120 }
```

33 The delimiters in the preamble

The command `\@@_delimiter:nnn` will be used to draw delimiters inside the matrix when delimiters are specified in the preamble of the array. It does *not* concern the exterior delimiters added by `{NiceArrayWithDelims}` (and `{pNiceArray}`, `{pNiceMatrix}`, etc.).

A delimiter in the preamble of the array will write an instruction `\@@_delimiter:nnn` in the `\g_@@_pre_code_after_tl` (and also potentially add instructions in the preamble provided to `\array` in order to add space between columns).

The first argument is the type of delimiter ((, [, \{,),] or \}). The second argument is the number of columnm. The third argument is a boolean equal to `\c_true_bool` (resp. `\c_false_true`) when the delimiter must be put on the left (resp. right) side.

```
8121 \cs_new_protected:Npn \@@_delimiter:nnn #1 #2 #3
8122 {
8123   \pgfpicture
8124   \pgfrememberpicturepositiononpagetrue
8125   \pgf@relevantforpicturesizefalse
```

`\l_@@_y_initial_dim` and `\l_@@_y_final_dim` will be the *y*-values of the extremities of the delimiter we will have to construct.

```
8126 \@@_qpoint:n { row - 1 }
8127 \dim_set_eq:NN \l_@@_y_initial_dim \pgf@y
8128 \@@_qpoint:n { row - \int_eval:n { \c@iRow + 1 } }
8129 \dim_set_eq:NN \l_@@_y_final_dim \pgf@y
```

We will compute in `\l_tmpa_dim` the *x*-value where we will have to put our delimiter (on the left side or on the right side).

```
8130 \bool_if:nTF { #3 }
8131   { \dim_set_eq:NN \l_tmpa_dim \c_max_dim }
8132   { \dim_set:Nn \l_tmpa_dim { - \c_max_dim } }
8133 \int_step_inline:nnn \l_@@_first_row_int \g_@@_row_total_int
8134 {
8135   \cs_if_exist:cT
8136     { \pgf @ sh @ ns @ \@@_env: - ##1 - #2 }
8137   {
8138     \pgfpointanchor
8139       { \@@_env: - ##1 - #2 }
8140     { \bool_if:nTF { #3 } { west } { east } }

8268 }
8269 }
```

In the pre-code-after and in the `\CodeAfter` the following command `\@@_SubMatrix` will be linked to `\SubMatrix`.

- #1 is the left delimiter;
- #2 is the upper-left cell of the matrix with the format $i-j$;
- #3 is the lower-right cell of the matrix with the format $i-j$;
- #4 is the right delimiter;
- #5 is the list of options of the command;
- #6 is the potential subscript;
- #7 is the potential superscript.

For explanations about the construction with rescanning of the preamble, see the documentation for the user command `\Cdots`.

```

8462   }
8463 \group_end:

```

The group was for `\CT@arc@` (the color of the rules).

Now, we deal with the left delimiter. Of course, the environment `{pgfscope}` is for the `\pgftransformshift`.

```

8464   \begin{pgfscope}
8465     \pgftransformshift
8466     {
8467       \pgfpoint
8468         { \l_@@_x_initial_dim - \l_@@_submatrix_left_xshift_dim }
8469         { ( \l_@@_y_initial_dim + \l_@@_y_final_dim ) / 2 }
8470     }
8471     \str_if_empty:NTF \l_@@_submatrix_name_str
8472       { \@@_node_left:nn #1 { } }
8473       { \@@_node_left:nn #1 { \@@_env: - \l_@@_submatrix_name_str - left } }
8474   \end{pgfscope}

```

Now, we deal with the right delimiter.

```

8475   \pgftransformshift
8476   {
8477     \pgfpoint
8478       { \l_@@_x_final_dim + \l_@@_submatrix_right_xshift_dim }
8479       { ( \l_@@_y_initial_dim + \l_@@_y_final_dim ) / 2 }
8480   }
8481   \str_if_empty:NTF \l_@@_submatrix_name_str
8482     { \@@_node_right:nnn #2 { } { #3 } { #4 } }
8483   {
8484     \@@_node_right:nnn #2
8485       { \@@_env: - \l_@@_submatrix_name_str - right } { #3 } { #4 }
8486   }
8487   \cs_set_eq:NN \pgfpointanchor \@@_pgfpointanchor:n
8488   \flag_clear_new:n { nicematrix }
8489   \l_@@_code_tl
8490 }

```

In the key `code` of the command `\SubMatrix` there may be Tikz instructions. We want that, in these instructions, the i and j in specifications of nodes of the forms $i-j$, `row-i`, `col-j` and $i-|j$ refer to the number of row and column *relative* of the current `\SubMatrix`. That's why we will patch (locally in the `\SubMatrix`) the command `\pgfpointanchor`.

```
8491 \cs_set_eq:NN \@@_old_pgfpointanchor \pgfpointanchor
```

The following command will be linked to `\pgfpointanchor` just before the execution of the option `code` of the command `\SubMatrix`. In this command, we catch the argument `#1` of `\pgfpointanchor` and we apply to it the command `\@@_pgfpointanchor_i:nn` before passing it to the original `\pgfpointanchor`. We have to act in an expandable way because the command `\pgfpointanchor` is used in names of Tikz nodes which are computed in an expandable way.

```

8492 \cs_new_protected:Npn \@@_pgfpointanchor:n #1
8493   {
8494     \use:e
8495       { \exp_not:N \@@_old_pgfpointanchor { \@@_pgfpointanchor_i:nn #1 } }
8496   }

```

In fact, the argument of `\pgfpointanchor` is always of the form `\a_command { name_of_node }` where “`name_of_node`” is the name of the Tikz node without the potential prefix and suffix. That's why we catch two arguments and work only on the second by trying (first) to extract an hyphen `-`.

```

8497 \cs_new:Npn \@@_pgfpointanchor_i:nn #1 #2
8498   { #1 { \@@_pgfpointanchor_ii:w #2 - \q_stop } }

```

Since `\seq_if_in:NnTF` and `\clist_if_in:NnTF` are not expandable, we will use the following token list and `\str_case:nVTF` to test whether we have an integer or not.

```

8499 \tl_const:Nn \c_@@_integers alist tl
8500 {
8501   { 1 } { } { 2 } { } { 3 } { } { 4 } { } { 5 } { }
8502   { 6 } { } { 7 } { } { 8 } { } { 9 } { } { 10 } { }
8503   { 11 } { } { 12 } { } { 13 } { } { 14 } { } { 15 } { }
8504   { 16 } { } { 17 } { } { 18 } { } { 19 } { } { 20 } { }
8505 }

```

```

8506 \cs_new:Npn \@@_pgfpointanchor_ii:w #1-#2\q_stop
8507 {

```

If there is no hyphen, that means that the node is of the form of a single number (ex.: 5 or 11). In that case, we are in an analysis which result from a specification of node of the form $i-j$. In that case, the i of the number of row arrives first (and alone) in a `\pgfpointanchor` and, the, the j arrives (alone) in the following `\pgfpointanchor`. In order to know whether we have a number of row or a number of column, we keep track of the number of such treatments by the expandable flag called `nicematrix`.

```

8508 \tl_if_empty:nTF { #2 }
8509 {
8510   \str_case:nVTF { #1 } \c_@@_integers alist tl
8511   {
8512     \flag_raise:n { nicematrix }
8513     \int_if_even:nTF { \flag_height:n { nicematrix } }
8514     { \int_eval:n { #1 + \l_@@_first_i_tl - 1 } }
8515     { \int_eval:n { #1 + \l_@@_first_j_tl - 1 } }
8516   }
8517   { #1 }
8518 }

```

If there is an hyphen, we have to see whether we have a node of the form $i-j$, `row-i` or `col-j`.

```

8519   { \@@_pgfpointanchor_iii:w { #1 } #2 }
8520 }

```

There was an hyphen in the name of the node and that's why we have to retrieve the extra hyphen we have put (cf. `\@@_pgfpointanchor_i:nn`).

```

8521 \cs_new:Npn \@@_pgfpointanchor_iii:w #1 #2 -
8522 {
8523   \str_case:nnF { #1 }
8524   {
8525     { row } { row - \int_eval:n { #2 + \l_@@_first_i_tl - 1 } }
8526     { col } { col - \int_eval:n { #2 + \l_@@_first_j_tl - 1 } }
8527   }

```

Now the case of a node of the form $i-j$.

```

8528 {
8529   \int_eval:n { #1 + \l_@@_first_i_tl - 1 }
8530   - \int_eval:n { #2 + \l_@@_first_j_tl - 1 }
8531 }
8532 }

```

The command `\@@_node_left:nn` puts the left delimiter with the correct size. The argument `#1` is the delimiter to put. The argument `#2` is the name we will give to this PGF node (if the key `name` has been used in `\SubMatrix`).

```

8533 \cs_new_protected:Npn \@@_node_left:nn #1 #2
8534 {

38 We process the options at package loading

We process the options when the package is loaded (with `\usepackage`) but we recommend to use `\NiceMatrixOptions` instead.

We must process these options after the definition of the environment `{NiceMatrix}` because the option `renew-matrix` executes the code `\cs_set_eq:NN \env@matrix \NiceMatrix`.

Of course, the command `\NiceMatrix` must be defined before such an instruction is executed.

The boolean `\g_@@_footnotehyper_bool` will indicate if the option `footnotehyper` is used.

```
9002 \bool_new:N \g_@@_footnotehyper_bool
```

The boolean `\g_@@_footnote_bool` will indicate if the option `footnote` is used, but quickly, it will also be set to true if the option `footnotehyper` is used.

```
9003 \bool_new:N \g_@@_footnote_bool

If the user uses too much columns, the command `\@@_error_too_much_cols:` is triggered. This command raises an error but also tries to give the best information to the user in the error message. The command `\seq_if_in:NoTF` is not expandable and that's why we can't put it in the error message itself. We have to do the test before the `\@@_fatal:n`.
